# 1. Quick Tips for New Users?

Yahoo group: hp8924
Date: 2008-03-20 01:22:33 UTC
From: radioman762
Topic: 1  Message: 1

Does anyone have quick tips for new users of the 8924C?

I have used other service monitors but not this one. I have one on the way and should have it in a couple days.

Thanks.

Fred,
I am in the same position as you are and that is exactly why i started
this group. mine will be delivered Thursday and we will start the fun.
my understanding is that this will be a great monitor for
us hams to use for general radio alignment and also repeater maintenance.

I have posted the manuals that i could find for this monitor in the
files section. although i have noticed that almost everything in the
manuals are aimed toward Cellular use i have been assured that we can
use this monitor for LMR/Ham use also.

## 3. power up

Yahoo group: hp8924
Date: 2008-03-22 05:12:09 UTC
From: john.borg77
Topic: 3  Message: 3

Hi All

Finally I recieved my hp8924c .
I spent hole day experiment with radios
and try to understand the buttons. but ,at least i find how TX and RX
work, its great.

My question is how long it take the hp8924c to powering up ?

I plugged in 240v and push the power button to on and it powering up
after 10 or 15 minutes.
Is this normal ?

My 2nd question is if some one know how to detect PL/CTCSS

Best Regards,

John 9H5IC

## 4. Received Mine

Yahoo group: hp8924
Date: 2008-03-22 15:08:42 UTC
From: radioman762
Topic: 4  Message: 4

I received mine a couple of days ago and tried it out last night.

After powering it up, it took a few seconds and then went into the boot routine. At first, I kept getting an error message that the reference oscillator was unlocked. I remembered seeing a picture of a unit somewhere that had a jumper on the rear panel. I found the jumper in the accessories and installed it. That got rid of the error message.

I got it into the spectrum analyzer mode and figured out how to make various adjustments such as bandwidth, etc. However, although I can change the high and low limits from the default 825 MHz, it doesn't look like it is actually changing frequencies.

The "grass" on the display doesn't change and a HT keyed up across the room doesn't register. I will have to look to see whether my Cushman has an RF generator that will go up to 825. If so, I will use it as a signal source and see whether the 8924 recognizes it.

I think that I am going to have to take a look at the HP-8920 documentation to see if it sheds any light on things. As I understand it, the 8924C is built on top of the 8920 platform and has the same underlying hardware and firmware with the CMDA stuff added. The 8920 documentation is available on the HP/Agilent website. Since the 8924 documentation seems to focus on the CMDA functions, maybe the 8920 reference material will be more helpful.

# 5. Got The HP-8924C Spectrum Analyzer Working

Yahoo group: hp8924
Date: 2008-03-23 04:01:21 UTC
From: radioman762
Topic: 5  Message: 5

I consulted the HP 8920 manual and determined that you have to set the center frequency for the spectrum analyzer, not the upper and lower limits. I am not sure how I overlooked this when I tried to do it without bothering to RTFM.

Next task is to get the tracking generator started.

The 8920 manuals can be found by drilling down from this page:

http://www.home.agilent.com

## 6. Help Menu

Yahoo group: hp8924
Date: 2008-03-23 16:20:19 UTC
From: radioman762
Topic: 6  Message: 6

I discovered that the 8924 has built-in help function that provides basic information about accessing and using a number of features.

The "Help" button is the 4th from the left in the top row. Pressing it brings up the help screen with full instructions about how to use this function.

A number of my questions about how to use such things as the spectrum analyzer and tracking generator were quickly answered far more quickly than by searching through the manuals. It is certainly a good place to start.

Hope that everyone is enjoying their 8924 as much as I am.

Fred

Fred,
it sounds like you are figuring a few of the features out. i have mine
and it all seems to work well. now if i could only figure out
how to use of if it really has a tracking generator.

## 8. Re: Help Menu

Yahoo group: hp8924
Date: 2008-03-25 06:11:49 UTC
From: radioman762
Topic: 6  Message: 8

Ray,

It does have the tracking generator. I think that this is covered to some extent on the help screen. It is tricky to get to the menu that turns it on, but I eventually found it. I haven't used it yet and I can't tell you the exact steps I used to get to it, except to say that I would have to experiment again to find it.

One thing that is useful about the 8924C is the ability to save, name, and recall various configurations. I have done this for a couple of things so that I can go directly to different functions without having to change all the defaults each time. It gives me a known starting point.

I no longer have to go in and change the RF settings from "channel" to "frequency", etc. Instead, I just recall the previously saved setup. I plan to do this the next time I find the tracking generator screen.

I am sure that there is a way to change the defaults so that it will power up with the desired settings, I just haven't had time to find this. It may also be relatively easy to do if you hook the 8924C up to a computer and program it. I think there is a lot hidden in this box that apparently originally listed for $49K.

Fred

# 9. Saving your setup

Yahoo group: hp8924
Date: 2008-03-29 03:05:39 UTC
From: K6PNG
Topic: 6  Message: 9

Here is how to save your settings so that you do not have to go into the config screens every time you start the monitor up.

To Save an Instrument Setup
1. Press and release the SHIFT key, then the PREV key to access the I/O CONFIGURE
screen. Select the storage media using the Save/Recall field. (The default storage
media is internal memory.)
2. Make any changes to the instrument that you want to save in a register.
3. Press and release the SHIFT key, then the RECALL key to select the SAVE function.
4. Use the DATA keys or the Save: menu at the bottom right of the screen to enter the
save register name.
Front-Panel Example
This example saves the current instrument settings.
1. Press and release the SHIFT key, then the RECALL key to select the SAVE function.
A prompt appears at the top of the screen asking you to enter a name.
2. Using the DATA keys, enter 123, then press the ENTER key to assign a name.

note: if you name the register POWERON rather than 123 the unit will come up in those saved settings.

The 8924c does cover the pcs freqs
from 1700 to 1900 with an add on
module. i have this add on but
have not messed with it as of yet.

## 13. New Monitor Assembly

Yahoo group: hp8924
Date: 2008-06-01 18:05:31 UTC
From: radioman762
Topic: 13  Message: 13

I just saw that there is a new monitor assembly for the 8924 and similar units on eBay. Look for item # 120264961782 ending soon. I have no connection with this listing.

It appears to be the entire assembly, not just the CRT, so it is probably plug and play.

Hi

Go to Analog buttons pres tx and transmit and you can see on display the
power dev, frq. etc.
on the rx side press rx and you have the frq ready adjust the signal
level and ctcss if you have

the hp8924c works fine for two way radios

Thanks

# 16. Recommended ? and what's one worth?

Yahoo group: hp8924
Date: 2009-01-05 06:27:09 UTC
From: wb6ymh
Topic: 16  Message: 16

I've been googling for 8924c info and just found this list. I'm thinking of bidding on one for myself for belated Christmas present. Since you guys have had yours for a while now I wonder if you like yours and if you think it's worth the $700 to $1500 they seem to be going for on ebay at the moment.

It sure looks like it does a lot of stuff but it also looks huge. I'll use it in the shack 99% of the time, but I might also take it to a mountain top from time to time if I can lift it, hi!

I'd appreciate any comments you care to pass on.

I did spend another $200 to replace the display unit (bad burn on the screen), but the unit out performs analyzers costing $30K and up. It is very heavy and is in my shop 95% of the time.

I like the 8924C.
It is bigger than the 8920 so a bit of a downside but if one ever
wanted to test a cell phone or site, would come in handy or not.
The tone features are not as easy to maneuver to as the 8920 either
but during my last calibration, supposedly a macro was put in to
gain quicker access to the feature.

Easy to set up and use to test radio gear.
Very nice tracking generator/spectrum analyzer.

Heavy but if you don't mind the exercise and lift carefully, its
movable. :)

I am in the midst of trialing some software from this group:
http://www.measurement.ashop.com.au/p/248506/rft-1000-rf-tools-
software.html
My 8924C is just coming back from being calibrated, should be here
in the next few days.

The software was originally designed for the 8920 but I was told by
some techs that it should work as well with the 8924C, here's to
hoping.
The interface is expensive, needs a GPIB to USB 82357B unit (we
think because of the data through put but would be willing to trial
other less expensive units) but the additional features of the
software should make this very attractive for shop use to those of
us that can't afford high dollar pieces of equipment. Additionally,
the GPIB interface would allow computer control of multiple pieces
of equipment with the GPIB interface.

We are using ours with an Eagle return loss bridge kits. Fantastic.

http://www.eagle-1st.com/default.htm

If you look at the duplexer tuning page, http://www.eagle-
1st.com/notes/duplex/dup.htm, you will see what I mean.
TXRX duplexer tuning notes show the sweeps better even though they
use an IFR A-7550, sweeps are the same regardless of which
unit...have them both.
The beauty of it all, tuning is done to a 50 MHz load AND you can
view the entire duplexer at once. Too sweet.

Amtronix or another site has just the bridge unit for sale at a good
price.
Amtronix also has a screen capture link on their site, works very
well. The interface cable is simple.

Is there a good connection for the display/scope units?
200 dollars seems fair.

I have not seen it mentioned by anyone so i will. make sure when you are looking at them on ebay you pay attention to what power rating the it is. from what i have seen you can get a 2,60 and 100 watt version. Depending on what you will be doing with your unit this may or may not be an issue.

From: travis8303
Topic: 19  Message: 23

If you decide to purchase a unit, there is a self test section with
many different testing options.
My recommendation is to have the seller run all the tests to verify
correct operation before the unit is shipped.

The first one I purchased didn't work well, ran the self-tests and
sure enough it failed a few of them.
With the shipping costs these days, you can both save some grief and
time by having the tests run prior to shipping.

Mine should show up today from being calibrated. :)

Will advise the group as soon as I can about my software trials.

Hello to the group, my name is Sonny - Ki4HZP.

Travis, I just told Mark about the group, we should see him soon. We talked some this morning, on the air about our ideas with the service monitors and are all on the same page. Maybe this weekend we will get a chance to play some with them together and get a better idea of what tests we will be setting up in the macro area and work on the general connection configuration with the unit under test. Mark and I will also need to get the PL/DPL set-up from you after you figure out how Rick set it up on your unit.

Skip, good to see you're interested in the 8924c. Your interest in this service monitor makes me feel that we may have made a good choice.

You know Mark ☐ Ki4SWB well, Travis myself and Mark all decided to collectively work with the HP 8924c units and so far (early hands on) we think it might be a useful unit for us. We all have one of our own. It will be cool to get one for you and we can learn together exactly what we can do with it.

We think you live about 30 miles from the shipping location of where we purchased our units. You might be able to go in person, pick out a nice one, and actually perform the "self test" diagnostic utility on a unit before you take one.

I can pass you a phone number and a call can be placed to verify this with the seller before you make the final decision on this equipment investment.

Skip, I just asked for the 8924c of mine to listen for 29.600000 it took that value and as I scrolled down Freq. I arrived at 9.600000 and anything lower a flag warning on the display was "Input value out of range"

Again, we just started to play with this service gear. I would think that it will do from 9.600000 to 1009.600000 as that seams to be the top end before the flag warning of "Input value out of range" Hope this helps.

Keep Playing Radio!

Sonny

Topic: 25  Message: 25

Well I didn't win the auction I was bidding on, it went crazy but I'll keep trying. Your tips saved me from buying a 3 watt unit by mistake. The guy insisted that his was a 6 (not 60) watt unit and that there weren't any 60 or 100 watt options. "And besides this is a CDMA tester which is of no use for a Ham radio". Sigh...

In the last 15 days on ebay a 3 watt version when for $775, 60 watt versions for $700, and $1257 and a 100 watt version for $805 and $975.

There's a stack of 3 watt version with a buy it now of $399, but they are in Hong Kong with a shipping of $300 and a description of "missing parts". Pass on that.

Other than the maximum input power are there any options that I need to make sure I get? Do I gather correctly that the tracking generator and spectrum analyzer were stock features, not options.

I'll have a "almost new" CE5 for sale if I snag an 8924C (grin)

I'm all ears! The one I bid on was from test equipment surplus in
Anaheim. He has one on his website for $2800 but they going for
considerably less than that on ebay.

Skip, we got ours from Joon Kyong. His helper is Sam. They do sell on ebay. Even with some minor problems we had with the transactions, they worked out everything very nicely.

The phone number for them is 714-778-5151.

I called Joon today just after I sent the yahoo message out to the group. I explained to him that you are interested in a good HP 8924c like we have and that you are not far from his location. I mentioned that you might be able to drive over in person and check one out for purchase. Joon asked that I pass on his number so you could call him and work out the details.

Heads up, they are not technicians¡¦ of this service gear. At least I do not think so. We did not talk about the possibility of you actually getting to put hands on before you purchase but you should ask if you could check one out before you pick it up. If you can work this out with Joon / Sam, get back to one of us and we will send you the instructions for the self-test diagnostic features you can run. You will need to bring one adapter (N male to female BNC) or one 50-ohm cable terminated with one male N and one male BNC. You will need one BNC ¡§T¡¨ connector (one male end with two female ends) and three 50-ohm cables terminated with male BNC connectors. Two can be as short as 6 inches but one will need to run from the back of the unit to the front, 2 or 3 feet long. With the above in hand, advanced diagnostic tests can be run on the unit.

When we got ours, in the beginning of November 2008 the ebay sales were between 800 and 1500 auction style and 2200 ¡V 3500 hard asking price. Junk and un-known condition units brought upper 600 ¡V 800. I called and worked with Sam, Travis and I gave $1060.00 for ours and felt that was fair and we paid another 85.00 for shipping them to us. Mark bid on one later that month and paid about the same I think. That was for a known good working 100-Watt unit.

I can tell you that they have many units; he asked how many more we wanted □º I told him you are interested in one good 100-Watt unit like ours and asked him to treat you like he did us.

The man who calibrated our units, Rick from Amtronix is very knowledgeable about the HP service monitors and treated us good (he is a ham) and knows Joon and his operation out there.

Give them a call and hammer out a deal, feel free to use any of our names for reference. We try to keep in the front of our minds that to an Amateur operator the world is really quite small.

Let us know what you end up doing,

Sonny

Thanks! Yup that's the same guy. I bid had $850 on a 60 watt model. I didn't really want to go higher as one sold for $700 within the last 2 weeks (from the same guy). But if I can work out a deal to run the self test and cherry pick a good one then I'll probably do it.

I've already bid on the current auction, I think I'll see how I do before I call him. I was planning on picking it up rather than having it shipped in any case. Maybe if I offer to bring cash money rather than using paypal he'll let me play. His auction states "This item is in good working condition and is guaranteed to work. If you receive the item and it does not function, please let us know and we will give you a full refund including shipping." so verifying it works before I walk out the door helps both of us.

I have plenty of cables/adapters so please send me the instructions!

Thanks !!

Sonny,
it would be good if you post the self test instructions
to the list rather than sending it direct. That way future users
can search the list for it.. not to mention i would like to run mine
through the advanced tests.

Topic: 19  Message: 30

Well, my testing may be limited this weekend.
UPS busted up the unit, as they normally do.
Unit is tough, for the abuse it took suprisingly little is wrecked...hopefully.

Parts are inbound and hopefully those will repair the unit sufficiently to trial run the software I mentioned in another post and run the self-tests to verify no other damage.

I will try to learn how to set up the Macros and where the Power-on feature is set up and stored.

If anyone on the group is going to need rf tuning or alignment tools, one universal tool was mentioned on the MastrII site, forget the number right now, but I have a few left if needed. They are $6 each plus shipping. I bought them direct from Motorola.
Here is a quote from the other site:
The Motorola 6684387C01 tool fits every coil and capacitor in a
Mastr II radio, including the warping capacitor on the ICOMs. I checked the
four items you mentioned, and verified that the tool actually fits them.
Naturally, it also can be used on Exec II and MVP radios, along with
many other models. I especially like the large diameter of the handle,
which makes it very easy to control the tool for fine adjustments.

Good to see the posts.
We will be posting soon.

Travis

From: travis8303
Topic: 32  Message: 32

Hello group,

My service monitor is back on track and repaired although not as confident that the calibration maintained as it was but it may have. A VX-177 transmit showed 446.000160 so hopefully it is still close.

Pictures of the inside and front of the repaired unit are posted at:
http://aa9nv.r2i.net/HP8924C.htm
A bunch of my notes/thoughts and explanations are included for your perusal.

The RFT-1000 testing is included on the page as well.
Screen shots tell it all.

Any thoughts, questions, comments, please send them over.

Thank you.

Travis

# 34. new owner adventures

Yahoo group: hp8924
Date: 2009-01-14 07:32:59 UTC
From: wb6ymh
Topic: 19  Message: 34

I met Joon today, he's a very nice guy. I had my doubts when I spoke to him on the phone but I don't think he liked my low ball offer!

There was no problem running the diags on site, Joon watched everything and was very interested in the writeup uploaded here (I gave him a copy). I don't think they've ever run any of those tests, they just go by the results of the automatic power up self test.

Unfortunately I didn't connect the cables correctly for the audio test so it failed a few tests. I was working partly in the sun and it was hard to read the screen and I've never touched one of these before. It also failed two RF tests.... so I asked Joon if I could try another one.

The second unit was in much rougher shape than the first one physically (busted BNC connector on the front panel, partially broken knobs, nameplate falling off) and it also failed some of the RF tests.

When I asked to try a 3'rd unit he kind of rolled his eyes and said he had sold 200 of them so far and only 5 had been returned. I was short of time and I didn't want to press the issue. He keep saying that I had got mine too cheap and would be happy to refund my money (grin).

So ... I brought the first one home, skipped dinner and played with it all night.

Initially 2 of the RF tests failed (in the receiver I believe), but they scrolled off the screen before I could really gather what the problem was. (I hadn't discovered the stop on failure option yet).

After playing with it for hours I ran the tests again to write down the particulars of the failures and report back here to see what it meant and ... drum roll... they didn't fail! I ran the tests several times and it seem solid now. There's a warning about a 15 minute warm up before running the tested which I ignored both times it failed, perhaps that was it??

There's also a bunch of relays that click during the tests, perhaps they needed some wiping ??

Anyway for now I'm one happy camper.

One thing that I noticed: There's a *BATTERY* on the memory card. There's also checksum test for the calibration values and and a test that will dump them. My unit reports no bad checksum and lots of good ones.

Some Tek scopes have battery backed CMOS memory that holds *FACTORY* calibration values. If the battery goes dead the scope needs to be recalibrated by TEK... which usually costs more than old scopes are worth... so I'm going to log my current calibration values in case my battery dies. I have no idea if I can re-enter the values or if the battery I saw has anything to do with the calibration values, but it seems like a prudent thing to do.

Thanks for the help and encouragement ... now I need some new RF projects to put it to use!

It's great to see friends here taking part in this experiment. I took delivery on mine (Also from our friend Joon)in early November. Kevin (N4KLB) drove Sonny, Travis and my units up to Amtronix for calibration while heading north for Christmas vacation. As a few people have pointed out already, Rick at Amtronix is a ham and specializes in 8924C's. He did a nice job at a reasonable price. Rick will be a good resource for us for future parts or repairs, which is a big deal because dome of this older test equipment is impossible to maintain.

So far I've done some basic checks against some other test equipment and the cal seems to be very good. I've also been following Travis'lead on the RF-Tools software and am very interested in that aspect. I'm not ready to say these are the best thing going just yet but I'd been looking for a reasonable service monitor for quite some time and just couldn't justify spending 3,000 for an old IFR unit no matter what. The 8924C seems like a good compromise and comparatively newer technology. If you're not bothered by the little screen and all the soft key menus, I'm finding its pretty easy to use. Rick setting them up so they default right into the analog mode is nice too. There is a lot to learn about programming these things and we have some PCMCIA cards in the works for storing more configurations etc.

Next operation to try is to tune up some cavities. I have a method I've used for quite some time with an HP 8640B generator, an older Avcom Spectrum Analyzer and a really accurate B&K frequency counter. I'll tune up some different cans using the old and new and decide what I like better. I'll probably hang onto what I have now but it sure would be nice to not have a big rack of stuff even though the 8924C is a huge box.

I'll share what I learn here as I go.

73 and a shout out to WB6YMH from the TLB hub of Central Florida!

Skips has a new toy, excellent.
Congratulations on your purchase.

I don't recall that I waited for the 15 minute warm up before doing the tests.
If you run them again without waiting please let us know if they fail or not.

The clicks of the relays, mine clicks during the tests.
The other time it clicks is running the RFT-1000 software: the monitor screen blanks, clicks, and then the screen comes up with the data/info for the particular measurement.
Anyone else hearing or not hearing clicks?

FYI group:
A recent question about onboard memory batteries response: The "8924 has a 3V lithium battery that should last some 15 years. Out of over 1000 892X units through here, I've only seen 2-3 bad."

As owners, if you find any data or new experience that you feel may be helpful for the rest of us to learn, please post it.
Or send it to me and I can post it for you.

I could make a section to the web page and start adding commentary, would be another easy to see what has been discussed.

Thank you,

Travis

I ran them the the next AM after posting my tale as soon as I could
after power up and they passed.

I also found a screen somewhere that had a count of how may times each
relay had been clicked during the life of the instrument! I didn't
write down where, but it was one of the test programs. I think my
counts were in the 1/4 million area. Reminds me of the old Timex
commercial ... "takes a beating and still keeps ticking..."

Well, it's for a microphone (grin). I haven't been able to find the mating connector however. The book describes it as a 8 pin din, but from looking at the front panel it looks like it's a 1/4 turn. All of the 8pin dins I could find had either regular screw threads or were just push in types (PC connector styles).

Assume it's the same as the 8920:

"This 8-pin DIN connector (see Figure 145 on page 580) is used for several functions:
☐ Mic In is used to modulate the RF Generator when the KEY IN line is grounded. This signal is summed with the external MODULATION INPUT signal. The Mod In To field of the RF GENERATOR screen sets the type of modulation (AM or FM) and sensitivity(%AM/Vpk or kHz/Vpk) for this connection.
☐ Key In provides control of the RF Generator's output state (on or off) and automatic switching between the TX TEST and RX TEST screens if the CONFIGURE screen's RX/TX Cntl functions are set to Auto and PTT). Screen switching occurs when this line is grounded.
☐ Key Out 1 and Key Out 2 provide a switch path to control external equipment (such as keying a transmitter). Key Out 1 and Key Out 2 are connected when the Ext TX key field is set to On"

# 43. SINAD testing

Yahoo group: hp8924
Date: 2009-01-19 02:18:11 UTC
From: travis8303
Topic: 43  Message: 43

Hello group,

I went through a few manuals and tentatively came up with a SINAD testing process/set up for our service monitors.

1) I haven't ever done this before
2) I am trying to learn
3) Any comments or corrections are very welcome

I uploaded the SINAD sheet to the files area along with one of the manuals. The other was too large so a search will be in order if you want it, its worth getting. One of the main reasons is that the 8924C documentation, at least what I have found so far, is sorely lacking in usable user-friendly information.
The 8920 manuals are much better and while not a match for our machines, they are a good lead in the right direction. With a little interpretation and creative thinking, click and you're in.

Initial testing puts my Maratracs at about 117-120 for 12dB and 115-118 for 20dB SINAD. Are these numbers approximately looking correct?
The best unit is a newer D43 at 120 and 118.

Will test a repeater and some HT's when I get a chance.
Part of the hold up is connecting the audio to the HP.

Anyone else having fun with the machine?

Great idea. I'll check it out.

I just joined today and I've had my C; 60W for a month now but have done more than simple Rx and Tx. Tend to use my Moto 2200 as I'm still gun shy.

I'm reading the posts and as others before me, we've figured out that the manuals are um...well, marginally helpful. Once I digest the info here, the 8920 manuals and some of the procedures posted here or in Files, I'm sure I'll be more comfy with my C.

It took a month, until today to put a UHF duplexer already tuned to 444.9/449.9 onto the bench and try to figure out how to "tune it". Well here I am for now...maybe tomorrow.

Appreciate everyone's effort in passing along what they have discovered and gleaned.

Mike, WB6WUI, Winthrop, WA and Costa Mesa, CA

# 46. Master Reset

Yahoo group: hp8924
Date: 2009-01-24 14:03:17 UTC
From: Tim Sawyer
Topic: 46  Message: 46

I did the POWERON as a 8920b setup as described in the files section of this Yahoo! group. Unfortunately it bricked my monitor. The eBay seller (Joon) took it back and gave me another. However, I subsequently learned how to do a master reset. I'm not sure if this would have fixed it but here's the procedure anyway.

Simultaneously press and the hold the PRESET and the HZ keys. Turn on the power and continue holding the keys until it beeps.

Good luck,
Tim, WD6AWP

Yes. The catalog page makes it look like a cheap plastic connector, but in reality there's a fairly robust cast metal shell underneath. The locking ring is plastic and there's a plastic cover over the back shell.

It is from the same family as the old style PC AT keyboard connector, but with 8 pins and a bayonet locking ring. An 8 pin DIN connector without the locking ring would probably fit, but pull right out.

I wouldn't say this you could lift the 8924C by this connector, but it would try!

# 50. mic connector pinout

Yahoo group: hp8924
Date: 2009-01-25 22:23:15 UTC
From: wb6ymh
Topic: 50  Message: 50

I've confirmed that the 8924C's mic connector pinout matches that of the 8920 shown in figure 145 on page 580 of http://cp.literature.agilent.com/litweb/pdf/08920-90221.pdf .

I tried to upload the pdf to the group's file area, but it's too big. Apparently there's a 5mb file size limit.

I won't list the pin numbers since HP didn't for some reason.

If you haven't already you should download the 8920 manual even if you're not interested in the Mic input as it has tons of information on LMR usage of the 8924c not covered in the 8924C manuals.

My finger tip modulates the 8924c with 60hz hum just fine, now to wire up a mic.

# 51. external monitor.

Yahoo group: hp8924
Date: 2009-01-26 04:53:40 UTC
From: K6PNG
Topic: 50  Message: 51

Hello All,

Has anyone thought of the possibility that we could
use an external monitor on the 8924c's? I notice that it appears
to have the ability, anyone know what kind of monitor it takes?
It would sure make things easier on the eyes looking at a nice big monitor.

I tried plugging it into my 55 inch big screen TV... no go.

The 8920 manual says "CRT VIDEO OUTPUT
This connector provides a signal for using an external video monitor.
The signal provides a duplicate of the Test Set's screen.
Operating Considerations
A multi-sync monitor must be used to match the video sync rate of 19.2
kHz. Examples of this type of monitor include - Mitsubishi Diamond
Scan, NEC 3D, Leading Edge CMC-141M, and Sony CPD-1302."

# 53. numb receiver trap!

Yahoo group: hp8924
Date: 2009-01-26 07:04:58 UTC
From: wb6ymh
Topic: 53  Message: 53

Make sure you have your 8924C configured to show the signal generator output level into a 50 ohm load, not emf. If you're in emf mode like I was you'll think your receivers are 6 db worse than they actually are!

In the past I've tested most of my rigs using a borrowed IFR and over the last week of playing with my 8924C I was starting to suspect the signal generator was stingy. Today while I was reading the 8920 manual I came across the 50ohm/EMF setting and found I'd been in EMF mode all along.

The configuration screen also has entries to adjust the antenna input and duplexer output. Mine were both at 0db, but if they were that would also be a possible source of confusion if your instrument came configured with some odd values.

> 118 for 20dB SINAD. Are these numbers approximately looking correct?
> The best unit is a newer D43 at 120 and 118.
>
> Will test a repeater and some HT's when I get a chance.
> Part of the hold up is connecting the audio to the HP.

I hear that, my HT (a Kenwood TH-G71) takes a 2.5 mm plug. After
buying an adapter I measured the following:

2meters:
12 db SINAD .162 uV (-125dbm)
20 db quieting .223 uV (-120dbm)

440:
12 db SINAD .154 uV (-123dbm)
20 db quieting .208 uv (-121dbm)

I guess I'm old school, my head works in microvolts and 20db quieting.
I don't think in terms of SINAD and dbm.

> Anyone else having fun with the machine?

Yes I'm having fun. Other than programming the thing in iBASIC or
talking to it via HPIB/GPIB I think I've now played with all of the
functions. (Well except for the CDMA stuff, but I do have an old CDMA

phone ... nah.)

# 55. Scope

Yahoo group: hp8924
Date: 2009-02-01 12:58:10 UTC
From: travis8303
Topic: 55  Message: 55

How do I set the 8924C up for performing the test on Page 7 of this PDF?
http://www.repeater-builder.com/ge/lbi-library/lbi-38503.pdf
Here are the instructions:

Connect scope, signal generator, and probe as shown in Figure 6.
Set signal generator level for 3 to 5 mV and modulate with 20 Hz at 12 kHz deviation.
With probe between P904-4 (or J601-1) and A-, tune L504, L520, L521, C521, T601, T602, and T603 for double trace as shown on scope pattern.
Preset T601-T603 to top of coil form before tuning.

I can connect everything but am not setting something correctly because I never get any waveform. The station is a working unit, I am just trying to see the waveform.
I have two different probes, one HP 1:1 and a Tectronics 10X, only tried the HP so far.

Same for the squelch waveform instructions on page 11, I must be missing a common thing to setting up the scope.

Any ideas or if you have already done similar testing would you please post or send them over?

# 56. Alignment, waveforms, more info

Yahoo group: hp8924
Date: 2009-02-01 13:30:38 UTC
From: travis8303
Topic: 56  Message: 56

Using the same reference:
http://www.repeater-builder.com/ge/lbi-library/lbi-38503.pdf

Question 1)
Page 4 spells out the alignment procedure, which I walked through and ended up with the rxvr going from -105 to -109, an improvement in my book but I am a rookie.
Is there a way to see the rcvr in a waveform similar to running the tracking generator on a duplexer?

Question 2)
Page 5 talks about the various methods of ICOM frequency adjustment. I tried two of them and am unsure about a third.
The first I tried was A.2, direct measuring at the junction of C411 and L402, which it states as three times the ICOM frequency? Three times plus the IF is where mine measured.
The next I tried was B.1, "'Count' the developed IF frequency at the tap of Z602-R2 on the IFAS board." This measurement was not the same as the first one and both produced similar readings?
The last one I attempted was B.2 but didn't get the loose coupling and of course, didn't get the beat in the oscilloscope either. :(

I have a GE test set but did not see results with the D setting for the OSCILLATOR/MULTIPLIER while adjusting 402 the second time.
The B setting didn't read either but my DVM worked very well in the correct socket metering positions for RF AMPLIFIER & SELECTIVITY.
Ideas?

Ok back to playing again today...and trying to learn.

Another manual with good information, seems to pertain as much or more than the 8920 manuals:
http://www.sambow.com/image/image_Files/8921A.pdf
Digging around for Oscilloscope information.

# 57. New Owner Question - Input Attenuation

Yahoo group: hp8924
Date: 2009-03-26 16:30:00 UTC
From: John
Topic: 57  Message: 57

I've had my 8924C for a couple of weeks now so I'm beginning to find my way around with a little less panic. The more I learn, the more I am impressed with this piece of equipment. Mine is a low-power (3 watt) unit. I thought I could use a 20 db (150 watt) attenuator on the RF input and then configure the attenuation for 20 db to provide a direct readout of RF power. Apparently not. Is anyone else using a 3 watt input 8924 with in-line attenuation? I can figure the power loss through the attenuator manually. I'm just looking for ways to make life easier and learn along the way. Thanks to everyone for you willingness to share what you've learned. This group is a GREAT place for a new owner to get up to speed.

# 59. power on issue

Yahoo group: hp8924
Date: 2009-06-07 19:23:59 UTC
From: wb6ymh
Topic: 59  Message: 59

I don't know if anyone else has had this problem or not, but it really scared me when I ran into it. If leave my 9824c unplugged for a while it will not turn back on when I plug it in, all I get is a clicking noise about once a second. Happily if I leave it plugged in (turned off) for a while (15 minutes or so) it'll come back to life.

If I unplug it briefly there's no problem and if I leave it plugged in and turned off there's no problem either.

I suspect this is not normal and at some point it's going to die and I'll have to deal with the real problem.

I've measured the off power both after it's been on for a while and immediately after it's been unplugged for a while and it's 5 watts in both cases. It has been suggested that perhaps there was an oven or something that needed to warm up after an extended period of being unplugged.

Has anyone else had this issued?

I keep mine unplugged when it's not being used. Too many thunderstorms around here to risk having something sneak in over the power line. Don't hear any clicking when I start it up in this condition. Takes about 10 seconds for POST beep, then about another 35 or 40 for POWERON configuration as I have it set to come up.
One thing I have noticed is the power supply seems to run hot in mine.

When it turns into a hard failure I'll certainly be interested, but
I don't want to ship the thing. I live within driving distance
of test equipment surplus so I'll probably try him first if I can't
fix it myself. I'd be interested knowing what the component was,
but if you don't care to say I certainly understand.

I gather the fan is DC powered? It doesn't spin up when the problem
occurs which was kind of surprising.

# 65. Power Supply repair

Yahoo group: hp8924
Date: 2009-06-11 05:33:54 UTC
From: Jeff Mathia
Topic: 65  Message: 65

If someone wants to send me a service manual for this unit then in exchange I will post the fix. I spent several hours troubleshooting this problem. I replaced the one component that causes the problem and one other that contributed and unit has worked flawlessly since. I have asked in the past but received no response, so I hope maybe an exchange of information would be fair to all in the group. Based on a number of these supplies I have fixed so far I am confident that it will probably happen to your unit.

Thanks for understanding

Jeff

I tried to upload the service information I was able to find
to the Yahoo group when I first got my 8924c, but it's too big
for Yahoo. It's also too big for my email program. You can however
download it directly from Agilent here:
http://cp.literature.agilent.com/litweb/pdf/08924-90061.pdf

It's an Assembly Level Repair Manual so it doesn't have complete
schematics, but it does have some useful information (like a list
of known spurs and the source!). For my problem it basically
tells you to "replace the power supply".

I've corresponded with Jeff off list and his quote was very
reasonable so I'm planning on having him fix my supply.

Skip,

If it helps, I don't normally work on service monitors but the power supply is fairly easy to remove.

There are pictures of the service monitor opened up on my web site.

http://aa9nv.r2i.net/HP8924C.htm

I replaced the power supply - pretty easy, the regulator board - more time consuming but not bad, and one of the BNC jacks on the front - more difficult.

I have not opened up a power supply but Rick at Amtronix is very knowledgeable regarding the HP8924C and its components.
http://www.amtronix.com/
He has worked on three of our 8924C units and walked me through getting parts and the repairs on one due to a UPS shipping disaster. UPS interprets "handle with care" stickers to mean "throw it off the truck".

Yup, still sore about it but the service monitor seems none the worse for the experience and has provided hours of service without a glitch.

# 68. As promised

Yahoo group: hp8924
Date: 2009-06-13 05:50:44 UTC
From: metroemt_jeff
Topic: 68  Message: 68

I will get the exact part ID location next time I have one opened up. Two electrolytic caps need to be replaced. The small one directly above the Green LED (1uf 50V) and on the second stand up baord adjacent to the green LED replace the 47uf 50V electrolytic. This is the one causing the supply not to turn on and click. I will get a photo and part location on the next one I work on. Be sure to apply heat sink compound to the heat sinks that attach to the top cover.

Hope this helps

Jeff

# 69. HP8924C RF Analyzer scan

Yahoo group: hp8924
Date: 2009-06-19 14:17:49 UTC
From: james a fosse
Topic: 69  Message: 69

Hello,

I just received a HP8924C Monday. Wednesday, I was able to get the RF Analyzer to scan frequencies and lock onto the transmitter output. I changed something and can no longer get the RF analyzer section to scan. It just stays at the frequency set in the "tune frequency" box. It does not matter whether the "tune mode" is set to auto or manual.

Can anyone help me find the setting that I changed and restore it?

regards,

jim fosse

From: John
Topic: 70  Message: 70

I've been enjoying my 8924 for the last few months. I have made considerable progress on using it for basic functions. One of the things I've NOT been able to figure out is the sweep/tracking capability. I was the successful bidder on an Eagle Loss Bridge Kit recently, so I need to get smarter. Can anyone give me a kick-start?

Thanks!

Have you looked at Help->Spectrum Analyzer (2 of 2) ? It describes how you enable the tracking generator.

The 8924C manual leaves much (all) to be desired. One trick is to use the manual for the 8920B instead. At least it has a (short) section on the tracking generator. It's not a great manual either but with and some playing around you should be able to figure it out. I haven't found any differences between the operation of the 8920b and the 8924c. Some screens are probably different as some people have said the 8920b is easier to use, but I've never used a 8920b.

You can download the manual from here:
http://www.home.agilent.com/agilent/editorial.jspx?cc=US&lc=eng&ckey=1000001120:epsg:man&nid=-11143.0.00&id=1000001120:epsg:man

Hints of the operation of the tracking generator start on page 522.

I think I've got a handle on basic sweep setup and operation. The 8924 is undoubtedly the most robust pieces of test equipment I have ever owned and one of the most frustrating at times. With everyone's help and encouragement, I may feel like I know how to operate this beast some day. Thanks for sharing your expertise the secrets you've learned.

New power attenuator and heat sink plus some software on a memory card
with calibration values. There is a guy selling upgrade kits
on eBay, but they aren't cheap ($450)

http://cgi.ebay.com/HP-8920A-8920B-8924C-100-Watt-high-power-upgrade-kit_W0QQitemZ270377221807QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item3ef3bcfeaf&_trksid=p3286.m20.l1116

# 77. 8924C startup test and failure rate

Yahoo group: hp8924
Date: 2009-07-21 09:47:07 UTC
From: cruizzer77
Topic: 77  Message: 77

Hi

I don´t have a 8924C yet, but it would probably be the only service monitor I could afford as a replacement for my broken down Stabilock. Probably somebody can answer a few questions:

- Does the 8924C have a startup self-test which will tell the user unmistakable if something is wrong?
- The lowest prices are usually from surplus dealers who haven´t tested the units in detail. Has anyone bought from one, what is the experience and how would you rate the risk of getting a broken one?

Regards
Martin

> unmistakable if something is wrong?

It does a few self-tests at startup, but there's plenty that might go wrong that the startup tests won't catch. There's a bunch of extended self-tests that are available through a utility menu, though, and if all of those pass (most requiring looping back an output to an input), there's a very good chance everything is AOK. (Running all the tests takes a good 10 minutes or so.)

> - The lowest prices are usually from surplus dealers who haven´t
> tested the units in detail. Has anyone bought from one, what is the
> experience and how would you rate the risk of getting a broken one?

I bought an untested 8924C from an eBay dealer and, indeed, it was broken -- the back-up battery was dead (easy fix) and a couple of the self-tests failed (not so easy fix -- there is no component-level service manual available for the 8924C). It was also rather more beat up than the dealer's "representative" photo suggested. He would have preferred to exchange it with another one to "try again," but didn't give me any problems when I told him flat out I just wanted a refund.

Moral: Be sure you buy from someone who's offering a money back return policy if you want something that "just works." Also note you'll still be out $50-$100 if you have to ship something back -- these things are heavy!

After returning the first one, I decided to pay noticeably more money (about 30% or so) to get a unit from Amtronix. Besides being fully tested, it includes a new CRT (nice and bright), the latest firmware (although AFAIK the last few firmware updates were almost entirely related to the cell phone-testing side of the 8924C; the analog radio stuff was completely stable for ages) and a certificate of calibration. I'm happy with it...

There is an automatic self test that runs on power up, but there are
also extensive tests you can run that require external cables to
connect outputs to inputs. If the automatic self test passes that's
good but not a 100% indication of complete health. I live within
driving distance of one of the main sources (Test Equipment surplus
in Anaheim) and he allowed me to run the extended test on the unit
I bought. If all of those tests run you know you're in good shape.
See the files area of this group for a writeup that Travis posted
on how to run the diagnostics.

One thing you might want to consider is the sellers track record
and the availability of other units should you get a lemon. Test
Equipment Surplus gets about 30 of these a month and has been very
good in supporting problems. Most of the people on this group
bought from him and I've heard nothing but good things.
If your seller only has a single instrument and you have problems
your options are limited.

One thing to watch out for is the power capability, most of the
8924c on ebay are the 3 watt version and upgrading them to 60
or 100 watts isn't cheap.

Good luck, I'm sure you'll love your 8924c ... it's amazing.

# 80. GPIB to USB Controllers on the HP8924

Yahoo group: hp8924
Date: 2009-07-21 20:48:22 UTC
From: Bob Murdock
Topic: 80  Message: 80

Does anyone know if the Prologix GPIB to USB Controller 6.0 works with RF Tools software?
RF Tools website (www.measurement.net.au) specifies the Agilent 82357B GPIB to USB Controller, which is extremely expensive.
The Prologix sells for $150.

Also, if someone has a Prologix they could send me I would be willing to try it on my system and verify whether its compatibility or not.
I am running a functioning RF Tools with the 82357B and my laptop. I could try the Prologix on my desktop as a clean install with RF Tools as well.

I agree with Skip. I have a 8935, bought from TES in Anaheim, and the one shipped first had a problem, he took it back, and sent another one, and paid shipping both ways by Fedex. I give him high points in customer service. Looked long and hard at 8924, but 8935 seemed smaller, and no CRT is a big plus.

Thanks for your comments folks.

The 8935 seems to be a fine unit as well, I even think that all of these have 75W input power. I think I'd like it but it's much rarer and often more expensive as well. Seems to be a bit smaller and 5kg lighter indeed. The 8924C is said to do everything a 8920B does, does this apply to the 8935 as well?

Living in Europe where hardly any HP service monitors are to be found the only possibility would be to buy in the US or Hong Kong, but then the shipping cost is so high that even TES would pretty likely not pay return shipping and paying myself would not be an option either.

Anyway, the prices asked by Amtronix and TES are sure a good deal but still too high for my purse. You see I'd be on a really tight budget.

Therefore it is bad news that the self tests have to be run manually, because some sellers do power the units on and take a screenshot, but this doesn't mean much then.

Regards
Martin

# 84. startup troubles

Yahoo group: hp8924
Date: 2009-07-23 14:02:43 UTC
From: dave
Topic: 84  Message: 84

I have an hp 8924 that says it passes self-test.
and then sets thinking for awhile then says

""This instrument's internal program has reached an
unexpected and invalid state. Please record the 3 lines
of text below and fax them to Hewlett-Packard/Service
Engineering at 509-921-3700. In the US, you may call the
factory at 800-827-3840.

'$Header: CDMACallCntl.m,v 25.3 97/07/09 15:58:39 hmgr Exp $'
at line number 4517.
Condition: 0

You may continue testing by turning the instrument power off
and back on.""

and there it sets.

You can turn power off and on and it will continue, but i would like to
get rid of the problem. Having a error like this does not give much
confidence
in the behavior of the machine.

Any suggestions?

For a completely locked up instrument the factory suggested a
master reset. You might try that ... I haven't since I don't
any problems like that. See http://groups.yahoo.com/group/hp8924/message/46 for details.

At least the problem appears to be related to the CDMA features
which you are probably not using anyway.

From: dave
Topic: 84  Message: 86

i had found this procedure in the maintenance manual and tried it but to
no avail
still get the problem. even when it says to power off and back on
sometimes it still get the error
at other times it works alright.

if this is a firmware problem is there any way to reload the firmware?
are there copies of the firmware floating around.

is the firmware on paper or a file somewhere that can be had. maybe
there is really a hardware
problem that the control program is seeing the self-test is not. is it
written is assembler or in ibasic
like some of the other stuff in the machine?

# 87. Audio HI input issue

Yahoo group: hp8924
Date: 2009-08-10 16:24:54 UTC
From: radionova327
Topic: 87  Message: 87

Hello all,

My newly purchased 8924 fails one of the built in tests. I would rather not return the unit.

The AFDIAGS3, Audio Analyzer 1 External Path test with the following error:
External Audio Input Lower .388 Upper .474 Actual .011. 1 path had a failure in this test.
Failure code 2. Suspect Audio Analyzer 1 (medium) or cable (medium).

I tired several cables and tested the input using the DECODE and
SCOPE screens and the high side input does not work.

I replaced the A35 board with the same results. I tested continuity from the three audio connections in the front (audio out, audio high, audio low) and they test good back to the other end of the 10 inch or so jumper. Upon farther inspection, the center pin on the J3 connector on the main board where the audio hi was plugged into is bent to the side against the ground.

I have the following questions:

Type of connector this is?
Part number/source for it (J3 on main board)
Can it get to the bottom side to replace it without removing everything?
Is the connection from J3 to the A35 board direct or is there some stuff in the middle?
Anyone have a schematic for the unit, I have the assembly level PDF.

One more question. I also have a cal issue on the RF mixer. After running the CDMA_CAL, Receiver First Mixer I get this error, HP-IB Error: Cal Value out of range. Is this just a cal issue that would be fixed with a new cal or is this a unit issue?

Thank you,
Tom N8LBT

The connector is looking like a SMB, now the question is how to get to the back side of the main board. I can't get at it from the bottom of the unit.

# 89. No Fan on power up

Yahoo group: hp8924
Date: 2009-08-18 00:21:15 UTC
From: zigs68
Topic: 89  Message: 89

Hi -

I have had an 8924c for a few months now and things were working great but just today I power up the unit and I hear no fans running when powering up like I used to. All self tests, etc are fine and the unit appears to work ok but with no fans I'm afraid to use it without the fans running - afraid things will burn up. Is the issue with the fan assembly which is a "replaceable" part in one of the PDF manuals I have? Where would you get an assembly and how crazy expensive is it?

# 90. Microphone and 60 watt mod

Yahoo group: hp8924
Date: 2009-08-23 18:37:29 UTC
From: wb6ymh
Topic: 90  Message: 90

Bruce, mail to your earthlink account is bouncing. Since you
are clearly reading this list and the information is possibly
of general interest I'm posting it here.

Skip

---
The only "microphone" I've used so far is the tip of my finger!
Since I got 60Hz hum I suspect it wants a crystal microphone. I'm
planning on using a Motorola DTMF mic with an adapter to provide
power and level adjustment... I doubt I get around to it anytime
soon. Finding the microphone connector was just a challenge.

Warning: You'll get a huge Mouser catalog every other month or so
by buying a $5 connector! Make me wonder how those guys stay in business!

BTW read the guy's auction on ebay again ... he's now allowing you to
do the install. He ships you a memory card and then refunds some
significant $$ when you return the card. The card is used to install
the calibration parameters for the attenuator, you only need it use
it once. It's still not cheap to upgrade, but it's a *lot* cheaper
and safer than shipping that monster around. I paid slightly over
$1k for mine, but it's a 100 watt version.

Skip

---
> Good Day Skip,
>
> Let us know what model microphone you end up using with that new connector.
>
> I purchased a very clean 8924C on eBay about 20 months ago for $800 shipped. The only thing missing was the Int to Ext clock jumper on the back, a couple of BNC elbow and a double female adaptors fixed that problem. It's been an outstanding service monitor and although it's heavy I have routinely lugged it to several repeater sites. For audio frequency response I run it in "duplex" mode, modulating the generator with noise and using the Baudline audio spectrum analyzer connected to the 8924 audio output BNC.
>
> I'll keep and eye out for that 60 watt mod on ebay, still pricey and I believe you have to ship the 8924 to them for the mod, that will cost more that than mod! The attenuators are not that difficult to find it's just the software mode we need to locate and we could then do our on mod.

# 91. 82357B USB/GPIB Interface High-Speed USB 2.0

Yahoo group: hp8924
Date: 2009-08-25 21:27:19 UTC
From: ki4hzp
Topic: 91  Message: 91

Hi gents, I have to clean out the shack. Several of us use the 82357B USB/GPIB with our 8924c units.

I have a Brand New 82357B with the IO Libraries Suite 15.1 that we have held on to for a back up unit. The three of us find that our service monitors and the Agilent GPIBs are so stable that we decided that a back up unit was not needed.

If you would like one for your service monitor needs contact me off list for the cost.

I will be listing it on some auction sites in a week or so if no one here needs one.

Remember,
Keep Playing Radio

From: Sonny
Topic: 91  Message: 93

Tom, N8LBT

In short, two of my radio buds and I decided to set up some 8924C units for ourselves about 10 months ago. We are using the RF tools package on all three units. As we set them up, we decided to make sure we had some back-up parts for the 8924C's and the extras we use with them.

The GPIB I have for sale is Factory new with the docs and IO Libraries Suite 15.1 CD. There is just no need to have a back up GPIB. We find the whole package extremely stable and very reliable. The sale price is not set in stone, it was determined by taking all four of the purchase prices of the 82357B's we have (They were all purchased at different $) and dividing by 4.

The price we need to get out of our (back-up) 82357B is $425.00, that way we all get good deals and you know on the front end you're not getting junk. I can ship it priority mail USPS to any of the lower 48. Tom, I would like to say that the RF tools and this GPIB made our 8924C's a tool most amateurs can only dream about.

The three of us use our 8924C's, a return loss bridge and the RF tools to take radio and all the peripherals to a first class level of operation. The service monitor alone has limitations on what is actually displayed on the screen in every mode. With the use of the RF tools and a PC interfaced with this 82357B (the only known GPIB that works without problems and is supported by RF tools) much more useful data is actually collected from the 8924C and displayed now on the PC screen for the ability of making the finite adjustments to all levels of radio service. If you like, your 8924C and you take the next step to interfacing it with a PC, your going to love it!

Call me at 321-288-7948 at your convenience / or I can call you; just send me a note with your number and a good time to call you so we can work out the details for the payment and part shipping.

Thanks for your note,

Sonny

Topic: 94  Message: 95

So I went out and "checked" my work again.
Before PTT, I clicked the tx power zero.
Upon PTT the "wattmeter" on the 8924c reads 0.0000.
Really frustrating.

The spec analyzer shows a clean peak coming out the the ground noise, so that "works".
I get good freq error readout that does vary when I "trim" the icom.

Just no "power" display.

Hope this helps.

I did something similar with a low band unit.
Tuned the exiter, excellent, connected everything, nothing.

The exciter tunes to the service monitor, which is fine for tune up but not for power out of the PA.

Retune the last two or three exciter settings with the PA connected as it will operate normally and you may see the wattage out right up. I tuned mine for maximum out and left it.

# 97. Error Code 4594

Yahoo group: hp8924
Date: 2009-10-24 16:38:44 UTC
From: radioman762
Topic: 97  Message: 97

After not using it for a few months, I plugged in my 8924 today and turned it on.

I received an error code of "4594". Despite cycling the power a couple of times -- as the screen instructed -- I can't get beyond the same error message.

Has anyone encountered this? I don't know what the message means or what the solution is.

Many thanks for any info.

# 98. TDR option?

Yahoo group: hp8924
Date: 2009-12-05 10:59:50 UTC
From: vk3zqv
Topic: 98  Message: 98

Hi,
Does anyone have any info on how to setup the 8924C to do TDR tests on my coax runs?
I have seen it mentioned as an option in the manual and also RFTools includes it as one of there functions.
Unfortunately RFtools will not work with my Prologix adapter so I would like to know how HP originally did it.
Thanks
Michael VK3ZQV

From: radioman762
Topic: 97  Message: 99

The problem seems to have fixed itself.

After I last tried it a few weeks ago, I happened to leave it plugged in.

Last night I decided to try it again. It passed the POST with no error message and seems to work normally.

# 100. need help using SA

Yahoo group: hp8924
Date: 2009-12-18 18:53:36 UTC
From: Paul Holm
Topic: 100  Message: 100

Hello,

I'm fairly new to using my instrument. I've experimented a bit with tuning some cavities but I am not mastering the subject. If someone could give me some pointers or even 'hold my hand' through this, I'd sure appreciate it.

I've got a 6-cavity BpBr duplexer that I am tuning at the moment. It has UHF connectors on it; two connectors per cavity. I have fabricated 1/2wl test cables out of RG-400 and have a 3dB pad connected to each cavity port. I can turn on the TG and see a trace and it responds to the pass tuning adjustment but I am not using the whole vertical extent of the screen.

I think I need help understanding how the generator level, reference level, and normalizing work together.

Thanks.

Topic: 103  Message: 104

Did you happen to check if the reading was accurate before you installed the 60w pad and uploaded the cal data (tested with a handheld radio at say 1-2 watts and saw what you got)?  The 60 watt pad just provides more attenuation than the 3 watt pad - the heatsinks are the same as you may have seen (and the pads themselves look the same as well).  The "cal data" tells the unit that this much attenuation is being provided so the power reading is correctly displayed.

If you bought this pad/cal data on ebay then you should be able to contact the vendor (he is the only one selling this I believe but there may be others).  If it is the same person he was very helpful on the phone with checking things out and seeing what may be the issue.  I did not have this power double problem when I did the upgrade - my question was on how to upload the cal data with choosing what options on the upgrade screens, etc. so I did not wipe anything out.  The rest has worked fine for me (so far....)

I know of at least one other PS that had the same problem and
replacing the caps as described fixed it. My power supply
on the other hand also had a bad FET. I had Jeff fix mine
and it's working perfectly now. Jeff's quote was very reasonable
and I'm happy with his service.

Advise: If you're going to take your power supply out for
repair go buy an electric screw driver and torx bits for it
if you don't already have one! It seems like you need to take
out a couple thousand screws! (I'm very proud of myself, I
only had one screw left over when I put it back together, grin).

I have "many" presets stored in/on my 8924c

The power on status is saved as "poweron" I believe.

I also have several other states saved as A1 or C1 etc etc

So do I, but my question was on the green preset button. I tried saving a base and poweron but the preset button still goes to the cdma
control screen. Guess it calls the setup from rom. By the way, if you try this backup your settings onto sram card as creating a base will wipe stored settings. Glad I read the manual ;)

> Has anyone used this output, if so what were the results?

I plugged mine into my 55 inch TV in the living room just for the hell of it. The TV wasn't able to sync to the scan rate. You'll need a "multi-sync" monitor which was common when the 8924c was designed, but not so much theses day.

According to the manual: "A multi-sync monitor must be used to match the video sync rate of 19.2 kHz. Examples of this type of monitor include - Mitsubishi Diamond Scan, NEC 3D, Leading Edge CMC-141M, and Sony CPD-1302."

From: abrigno1
Topic: 111  Message: 111

What type of printers work with the HP8924C?? Most of the ones listed are older but I set up using the "Deskjet" listing and I tried a Deskjet 720 which is a later model Deskjet - without success. I have an older Laserjet 4P which works well on another computer but is super large and not too convenient. I have checked out the Deskjet 720 on another computer and it is working fine. I could try the Laserjet but thought some of you are surely printing using the printer port.

Is there any trick to printing that I am missing. I use the shift hold and then hit print and I get nothing. As many of you have pointed out the manual leaves a lot to be desired.

Hey Tony,

There was a time when HP made some "host based" (or sometimes called "Windows only") printers that won't work without some sort of a computer "host" driving them. This includes.

HP Deskjet 710C, HP Deskjet 712C, HP Deskjet 720C, HP Deskjet 722C, HP Deskjet 820Cxi, HP Deskjet 820Cse, HP Deskjet 1000 Series, HP Original Photosmart printer (Part #: C3804A), HP LaserJet 3100 products and HP Officejet PSC 500.

I can't say for certain what WILL work, but you will most likely have problems with any listed above.

Cheers,

Mike

Tony,

I don't know whether you have seen the free program that allows you to capture the 8924C screen on your PC and save it as a bitmap file?

http://www.amtronix.com/8920btsinfo.htm

That should allow you to print it with whatever printer you have. Not a direct printer connection, but it might give you the printout you need.

73,

Fred

# 114. Instruement Check Out

Yahoo group: hp8924
Date: 2010-02-28 16:41:25 UTC
From: abrigno1
Topic: 114  Message: 114

Checking out instrument and getting used to moving around menus etc. Like it so far but it is pretty daunting and manuals are large and not much help. Found help screens to be most help so far. making progress. I would like to hook up local printer to printer port and have previously posted message about what printers work best. I have tried a Deskjet 720C and it doesn't work on 8924C but it works fine on local PC.

My HP8924C;

Firmware A.08.02

Boot Loader A.02.02

I have ntoiced something I can't find in the manual

On start up I get a quick flash message that says "Cal file checksum incorrect. File reset to default values." My gut first guess is that I need to run some type of calibration utility. Any help would be appreciated.

Unit then goes through the start-up sequence and gives the message that all self tests pass. It then comes up and appears to work properly.

Thanks for the reply. I appreciat the insight and help. The Hp 8924C is new to me. I got it off EBay and so far am crazy about it.

Sure have seen the BTS utility and have downloaded it. I plan to try it out in future. I would like to have a dedicated printer in shop to just do routine things. It saves the hassle of using a separat computer. I can use the laptop and screen capture for stuff I want to email.

I presently have an HP 141T Analyzer/Tracking Generator and I have used my Cannon Elph 8 Meg digital with macro to photo screen. It does a remarkably good job and is quick and dirty. I could use that if needed.

It's certainly not LOUD, but at near full volume it's not distorted and I can comfortably use it for a monitor receiver while wondering around in the shack. It's plenty loud enough to get above the sound of the fans and HDs of my plentifully assortment of boat anchor PCs. How many milliwatts, beats me.

From: abrigno1
Topic: 111  Message: 121

Thanks to all who commented. I have ended up using an HP 660C Deskjet and it is working great. Set it with no FF before and one after data in confiugure screen. Mike, reminded me that later Deskjets - 700 series and higher need Windows platform. Only drawack is size and Cartridge availability and cost (aftermarket at Office Max $30) Print out is little grainy but more than adequate and easy to use. Guess is 600 series and earlier should all work.

I also have the portable 340 and 320 and will probably try those in the future but not a high priority now.

Next project is to use the Screen capture routing on laptop.

What kind of drivers? If you need, e.g., instrument interfaces for LabView over GPIB (or most any software), those for an 8920 work -- although, truth be told, in many cases such LabView "drivers" as so bare-bones you're better off just sending/receiving GPIB commands directly.

The 8924C also has a pair of serial ports, and you can use one for, e.g., screen capture using a utility HP provided. See: http://www.amtronix.com/8920btsinfo.htm

You'll probably have more luck on National Instrument's web site for LabView drivers... e.g., these for the 8920:
http://sine.ni.com/apps/utf8/niid_web_display.model_page?p_model_id=2042 (there might be others -- that's just the first one I found).

You have to use a multi-sync capable monitor as the frequencies are different.

19.2kHz for the CRT vs. 15.734kHz used in NTSC.

I have been trying to find a monitor for my 8924C. The mulitsync units I have found are fairly expensive.

Has anyone tried the converters that convert composite to VGA?? I cannot find any specifics as if they are fixed tuned to NTSC sync rates or have ability to handle the 19 KHz required. These units are readily available on Ebay in the $30-50 range and would be great if they could use the existing VGA LCD monitors.

# 131. Re: Video Monitor

Yahoo group: hp8924
Date: 2010-04-05 11:03:26 UTC
From: travis8303
Topic: 129  Message: 131

There are a number of us interested in external monitors.

I have emailed a number of the converter vendors and the response across the board so far has been "no". Mostly they explain the units are for the CATV 15 KHz frequency and won't operate higher like we need for the 8924C.

I have called and emailed many people about any type of solution for displaying the 19.2 KHz horizontal sync signal but so far, all dead ends.

Talked to a repair shop, it could be possible to swap out the video section of the service monitor but the expense and time would probably be prohibitive.

Does anyone live near or have access to a shop that might have security or medical monitors? Maybe they would let you take the HP on site and you could try a variety of monitors?

Does anyone know how to, or if it is even possible to, convert the composite video to RGB or another type of data that could be used?

Some of the Sony commerical monitors will do 15 to 30 KHz horizontal sync but it wants an RGB feed instead of the composite video. Composite only goes down to 22 KHz or such.

If anyone has any additional leads or thoughts as to how this might be approached, please post the information.

Would it be possible to build a video converter for the composite video? Or have someone build one?

I have found a monitor that works at the local NPR TV station but it is big and expensive if I buy one.

I will keep trying to find some type of converter and will post any progress.

The station engineer at the NPR station is a 40 year + ham and very knowledgable. I have not had time to talk in detail with him about options. I am pretty good on general radio but not so much on the video end of it so I need to pick his brain. If I come up with anything I'll post it.

Subject: [hp8924] Re: Video Monitor

There are a number of us interested in external monitors.

I have emailed a number of the converter vendors and the response across the board so far has been "no". Mostly they explain the units are for the CATV 15 KHz frequency and won't operate higher like we need for the 8924C.

I have called and emailed many people about any type of solution for displaying the 19.2 KHz horizontal sync signal but so far, all dead ends.

Talked to a repair shop, it could be possible to swap out the video section of the service monitor but the expense and time would probably be prohibitive.

Does anyone live near or have access to a shop that might have security or medical monitors? Maybe they would let you take the HP on site and you could try a variety of monitors?

Does anyone know how to, or if it is even possible to, convert the composite video to RGB or another type of data that could be used?

Some of the Sony commerical monitors will do 15 to 30 KHz horizontal sync but it wants an RGB feed instead of the composite video. Composite only goes down to 22 KHz or such.

If anyone has any additional leads or thoughts as to how this might be approached, please post the information.

Would it be possible to build a video converter for the composite video? Or have someone build one?

> Has anyone tried the converters that convert composite to VGA?? I cannot find any specifics as if they are fixed tuned to NTSC sync rates or have ability to handle the 19 KHz required. These units are readily available on Ebay in the $30-50 range and would be great if they could use the existing VGA LCD monitors.

Here's an idea... the guys who keep "classic" arcade games around often have the same problem, wanting to use modern monitors with old arcade games that used various now-uncommon video formats and scan rates. There is a nichey but active market for converter boards for these guys... see, e.g., http://cgi.ebay.com/RGBS-CGA-EGA-YUV-TO-VGA-converter-1-output-arcade-game_W0QQitemZ250593765979

Although it doesn't specifically state "19kHz, composite video input," I'm willing to bet that little additional signal processing is required to "fake it" using the CGA/EGA input (e.g., you might need to add a sync separator circuit, I'm thinking) -- but at its core those boards really are a complete A to D converter, frame store, and then D to A converter with a standard VGA output wherein the input and output timing don't bear any resemblance whatsoever, which is what you want.

> If anyone has any additional leads or thoughts as to how this might be approached, please post the information.

I saw a web site not too long ago where someone actually went to the effort to pull the digital video data and timing signals off the PCBs internal to a spectrum analyzer, I think it was, digitizing it and then feeding it to an FPGA that was then connected to a PC so as to provide a means of reading data out of the device (since it apparently didn't have a regular GPIB interface or whatever). That's some really heavy-duty effort there!

# 135. 8924, 3 watt to 100 watt conversion.

Yahoo group: hp8924
Date: 2010-04-30 21:53:50 UTC
From: WA9FVP
Topic: 135  Message: 135

You don't have to spend a fortune converting your 8924 to measure 100 watts. I purchased a 100 watt, 20 db power attenuator on Ebay for $25.00. Simply connect it to the RF In/Out port and change the RF level offset in the Configuration menu to "ON". Just below that is the setting for the offset. Changed it to -20db. If you want better accuracy measure the attenuator using the 8924 generator and an RF power meter. You can measure the exact attenuation including the cables. Enter that number as the offset. My attenuator and cables measured -20.2 db. The 8924 will compensate for the attenuation and when you apply 100 watts to the attenuator, it will read 100 watts. I uploaded a file showing a picture of my setup and a screen shot of the Configuration menu. Remember if you use your setup at a higher frequency, the attenuation may change. Use a different offset and save it using a new filename.

# 137. BTS Screen Capture Software

Yahoo group: hp8924
Date: 2010-05-01 15:12:57 UTC
From: abrigno1
Topic: 137  Message: 137

I installed the BTS software on my laptop and it works great. It works little different than the instructions on the Amatronix web site but figured it out pretty easy. I am using Compaq RS2176 with an AMD 1800 Mhz with Win XP SP3.

I was able to save screens to USB zip and easily incorporate them into a Power Point presentation.

Still messing around tryng to find composite to VGA adapter but it is lower priority as screen is good and screen capture and local print work great. (Old HP DeskJet 660C works great)

Bought Return Loss Bridge from Amatronix and it works great. Highly recommend it. Eagle is little better but cost ton more. For my ham work Amatronix bridge is super.

I have done a similar thing here. I found a 300 watt, 30 db power attenuator on ebay ($75?)that is supposedly good to 3 ghz. So I can use the 200 milliwatt input to 200 watts. Seems to work fine.

I have not tried the offset function in the configuration menu as multiplying by 1000 is pretty simple. But it does seem like a great idea though.

A 20db attenuator connected to the RF IN/OUT port divides the power by 100. On the other hand, the generator output decreases by 20db. By adding the offset, to compensate for the loss, the 8924 software increases the generator level by 20db. The drawback is that the generator's maximum signal is limited. The maximum calibrated level on my 8924 is -30dbm. However it's not a problem while testing receivers, I never need more than 1000uv or -47dbm.

When you use a 30db attenuator, your loosing another 10db of signal level and that's getting close to -47dbm. A 10db, 100 watt attenuator on a 3 watt 8924 isn't enough because the power level at the attneuators out port is 10 watts. 20db of attenuation is the best choice.

From: WA9FVP
Topic: 137  Message: 140

I use the BTS software on a 2647 IBM Thinkpad that I purchased on Ebay. New laptops don't have serial ports and I didn't want a large investment for fear that a USB to serial adapter wouldn't work. I can print just fine over the wireless network to an HP 5150 printer connected to my desktop computer.

# 141. Return loss for coax

Yahoo group: hp8924
Date: 2010-05-03 23:39:13 UTC
From: abrigno1
Topic: 141  Message: 141

Need some help from the guru's.

I am trying to measure the RL on an old piece of RG213 with PL259 on each end. I am doing this to help familiarize myself with the procedure and the 8924C. I am getting some results that I can't understand.

I am using the Amatronix RL bridge and the RF tools software. I run the RL program with a sweep from 100 to 500 MHz first with the bridge DUT open circuit. I them connect the 50 ft piece of coax and finish the run.

I am getting a return loss of around 3.0 Db at the 100 MHz end and about 13 dB at the 500 MHz end. This is totaly confusing me. If I do a run and terminate the coax with a professional dummy load on the second part of the run I get around 34 dB at the 100 MHz end and around 12 dB at the 500 Mhz end. This makes sense to me but seems high. When I do a straight sweep using the 8924C tracking generator without the bridge I get results that are a little higher than new cable and agree with a 30 year old piece of good condition foam coax.

I am missing something realy simple here. Any thoughts or ideas would be appreciated.

Would still appreciateany comments but think I have it figured out. It was right before me and I couldn't see it.

You can leave off any comments about being a "dumb ass". I figured that out on my own.

I once spent about an hour trying to explain to one of my customers in France what the term "if it was a snake it would have bitten me" meant. He was having a terrible time grasping the meaning of the expression. Now I think I know how he felt.

First you should check your test setup. Replace the coax with a 50 load. If the results are still bad, there's something wrong with the test setup. The RL Bridge normally has a terminated port and if the termination is bad it could be why you're seeing erroneous results.

I believe the display unit is similar to one used in ICOM R9000 receiver. Those have a problem I have seen where cold solder on an electrolytic capacitor in the deflection circuit will create this problem. Look for cold solder, especially with capacitors mounted vertically on board.

# 149. power on issue

Yahoo group: hp8924
Date: 2010-05-11 03:58:58 UTC
From: tektoolz
Topic: 59  Message: 149

Well, I found some time to pull my 8924 power supply board and repair it and I took a photo of the board and labeled a few parts. I removed J3, J4 & J7 boards to remove and test the capacitors. I found C5, C10 and C11 to be defective. I also found a ring crack on R29 and re-soldered it. I did not show it in the picture as it is under a heat sink. It looks like a 5 watt resister and the board was discolored at its location. It looks like the board was reworked at one time as the previous tech did not clean the flux from his work. I uploaded the board photo and also a zipped copy to the files section. Hope this helps someone out.

C5 47uF 50V (on J3 board)
C6 33uF 25V (on J3 board)
C7 33uF 25V (on J7 board)
C8 33uF 25V (on J7 board)
C3 & C4 100uF 35V (on main board)
C10 1uF 50V (on main board)
C11 4.7uF 50V (on J4 board)
C16 100uF 35V (on J4 board)
C17 33uF 25V (on J4 board)

There is nothing at the audio output jack from #1 audio oscillator when it is switched there, but when I switch on #2 audio oscillator there is audio at the audio output jack when that is selected. #2 oscillator also modulates the test RF signal just fine. #1 audio oscillator seems dead.

I guess this is not a common problem.

# 154. Calibration - Who, and How Much?

Yahoo group: hp8924
Date: 2010-05-21 01:01:29 UTC
From: Josh
Topic: 154  Message: 154

I'm a ham operator who recently purchased an 8924c (in fact, it hasnt arrived yet). Who are you guys using for calibration, and what have you been paying? Are you finding this is necessary? I'm not working in a lab here, I'm an amateur.

The first company I called said 'we dont do that unit'

I would be surprised if you can find anyone who does this at an affordable price.

Does it pass all self tests including the ones you invoke with internal software where you loop back audio and RF? Make sure you warm up over 15 minutes as recommended or expect minor failures.

You can _calibrate_ the frequency reference manually through an internal software routine, but the other calibrations require use of HPIB, an array of test equipment and a pricey $700 calibration software.

If you want to _verify_ its performance, you can check the freq reference versus WWV and you can check the RX deviation meter by offsetting a CW generator +/- the center frequency. (Use DC coupling on the detector/demod) The TX deviation generator you can verify with an external receiver and DC scope on its discriminator, using the CW offset method to calibrate the scope. (Or use the duplex mode to check against its own generator if you have verified it is deviating correctly). The power meter and RF generator verification will require that you have an external power source and receiver of which you have confidence of their performance.

I am hoping someone in the group will shake loose some calibration software or a method to edit calibration data.

Rick Bowman at Amtronix will do it at very reasonable price for hams. Only problem is shipping and packing the heavy instruement to go to NJ/NY area. For specific info go to Amatronix and send note to Rick. He has been a great help to me and others.

The internal calibration routines are probably good enought for most things if it passes all self tests.

Call Rick at Amtronix.

He does great work, stands behind his work and provide excellent customer service.
Three of our units are almost 18 months post calibration and all of them still work well and seem to have maintained where he put them.

There is some information on the audio generators in the assembly level repair manual. The generators are on the A15 signaling board. Maybe re-seating the board will help.

Yay, mine arrived today via fedex. Well packaged, and survived shipping well.

Question for the group - The auction photos on the unit I purchased showed a different version of software than what is on my unit. I'm running A.06.33 - does that matter, do I care, should i upgrade it, whats the process/risk ?

Josh

Mine arrived yesterday with the A.08.04 firmware. Yes, it was very well packaged. The only problem I have with mine is it's going to take a LOT of work to get all the grunge cleaned off if it. Seriously, it looks like it has decades of smoke residue on it. My fingers turn black just handling it. [sigh]

Other than that, it (so far) checks out OK.

Josh, not sure what accuracy you need but I would recommend that you run all the self calibration tests and then check it against some local standards to see just how close it is. I use the NOAA at 162.475 and the local NPR digital TV station to check. I am no more than about 100 cycles off the NPR station and They use a cesium ion standard so I can check with the station engineer (ham W4OQG) to see where they are vs. that.

Rick can/will do an excellent job but if you don't need super accuracy you can save yourself some bucks and hassle.

I am a ham and 100-200 cycles is fine for what I do.

If your main concern is frequency accuracy, another option is to use an external frequency standard such as a GPS disciplined oscillator. This is easier than it may sound as there is a coaxial jumper on the rear panel that can be removed to disconnect the output of the internal standard and to connect an external standard instead.
The cost of a Z3801A, Z3816A, or similar unit would be significantly offset by the calibration fee and the round-trip shipping for the 8924.

If you need the whole thing gone through, professional checkout and calibration is way to go. I found in checking my 8924 against my Z3801A that the internal frequency standard is very stable and accurate after warm-up.

Josh,
One of the simple checks for frequency is to just dial up 10 mhz (or other accurately known signal) and hook an antenna to the antenna in port. Then push the transmitter test button and turn the attenuation down to where you get a reading. The diplay in the upper left shows how far your timebase is off. Mine pretty much says "0" most of the time for WWV when signals are good.

While this is probably not the ultimate test for accuracy, it's probably good enough for most ham use and is quite simple to do.

Josh,

Make sure that the timebase jumper is connected on the rear apron. If it's not there, you will get a time base error message.

HP made a change at some point from relay-switched attenuators to PIN diode (electronic) switches, and while the later is deemed more reliable over time, the low-end frequency response isn't as good (but deemed "good enough").

The blurb at the bottom of the page here has a more in-depth explanation:

Josh,
I believe that the level calibration and sensitivity are only accurate above 30 mhz. Anything you get below 30 mhz is a bonus.

Hook the output to the input and do the tracking gen thing. If you do a 50 mhz center freq with 100 mhz sweep you'll see the bottom drop off.

Still a very cool tool.

This is not the case on mine. I set up the test you describe, and mine doesn't fall off until about 400kc, but you're right, it's very obvious on the spec analyzer when running the tracking gen.

So it sounds like I have an early unit, from the sound of things. Works for me - for the casual use it gets, I'll take it :)

This thing is getting cooler by the minute.

From: Paul Holm
Topic: 170  Message: 172

Josh,

Here's what I've learned with mine. Somebody check me if I've gotten it wrong.

The 'Span' is for the whole width of the display. If your Span is 10Mhz, then each division is 1Mhz.

On the vertical scale, the divisions are always 10db each. The vertical scale always shows 80db total. The top line is the Reference Level. If your 'Ref Level' is set to 0db, then your vertical scale shows 0 db at the top and -80db at the bottom. If, for example, you'd like to see the bottom of a notch, then set your 'Ref Level' lower to say, -30db. Then your display will show -30db at the top and -110db at the bottom. I believe the noise floor of the SA is down at about -120db.

Interesting comparison chart.

It is not clear whether the E6380A and E8285A will both do CTCSS and 1000 HZ test tone simultaneously. Apparently the both have 2
Variable Audio Tone Encoders which would imply that they could. Does anyone know for sure?

Paul,
10 db per division vertically is the normal default and probably the most useful scale factor, but 1 and 2 db per vertical division are selectable as well. Very handy when trying to wring the last bit of performance out of something, but PITA other times when trace is off scale and you can't find it. Been there, done that.

# 176. Firmware Upgrade

Yahoo group: hp8924
Date: 2010-05-31 03:41:14 UTC
From: WA9FVP
Topic: 176  Message: 176

I purchased my 8924C about a year ago only to find out that it had a Beta version of software, X.06.18. I recently purchased a firmware upgrade on Ebay, version A.06.33. I had about 20 setups that I stored in the internal memory and according the instructions, they would be erased by the upgrade. The instructions listed the steps to store the registers to the PCMCIA card. I have a 1 Mb Verbatim, PCMCIA card with ample space and I proceeded with the step by step instructions.

After doing about 5 setups, I decided to check the card by pressing the recall and selecting my setup. The 8924C locked up and an error message appeared on the screen instructing me to call HP tech support and give them the error code. I decided to scrub the process and go ahead with the firmware upgrade.

After the upgrade checked the analog functions and I didn't notice any changes. There were steps to re-calibrate the TX power, DC current and DCFM offset. I did that. I decided to check card again and try to recall one of my setups. This time it worked! If I would have copied all of my setups, I could have retrieved them from the card.

Lesson learned!

Hi,
I wish to use my unit for cable fault location and am wondering if anyone in the group has the HP 11807A option 100 test card for sale or knows how to program the HP 8920C to do this function.
Cheers

# 180. Saving registers to a card

Yahoo group: hp8924
Date: 2010-06-13 04:45:11 UTC
From: WA9FVP
Topic: 180  Message: 180

I have a verbatim 1MB PCMCIA SRAM card and I was saving registers to the card. The steps are very tedious and if you have 20 or 30 registers to save, it can take a long time. (see Below)

Select I/O config screen (SHIFT,PREV) Set the Save/Recall field to Internal.
Recall the internal register you want to preserve (press RECALL and select the register name).
Select I/O config screen (SHIFT,PREV) Set the Save/Recall field to Card.
Press the PREV key to restore the the screen to be saved.
Press SHIFT,SAVE, enter the file name (new or Original) with the knob, choose DONE with the knob.
To save additional registers, change the Save/Recall field back to Internal to access the next
saved register and repeat the process.

Does anyone know if there's a better way?

# 181. Re:Audio problem

Yahoo group: hp8924
Date: 2010-06-13 04:59:58 UTC
From: WA9FVP
Topic: 151  Message: 181

I don't have one but the problem could bad a bad op-amp. I had a problem my 8924C where the RF power measurement was dead. I removed the top cover on the RF casting and with the internal video monitor connected and off to the side, with no schematic, I was able to trouble shoot the problem. It was a bad op-amp in what I think was the power measurement circuit. I replaced it with a surface mounted TL084.

To this day, it still works. I'm sure the audio generator is a plug in module filled op-amps or even a DSP. Without extenders and schematics, it would be very difficult to fix.

Rick at Amtronix can sell you a pcmcia card with the RF tools "package" on it.

Distance to fault, etc etc.

Would be my first choice for certain.

Good luck

From: Tony Brignole
Topic: 182  Message: 184

I bought the RF bridge and RF tools from Rick and Amatronix and they work super. The price is very reasonable. It does a great job on cable fault. Only issue is the 8924 is not very portable.

I have a Tektronix 1503 and I generally use if for cable fault as it is battery powered and I am familiar with it's settings.

We have several guys here in our ham club who have built TDRs from article in QST if you have good fast scope. They are cheap and easy to build if you have time for and want a project. You do need a pretty good scope to use for the display. I have worked with the home built units and they work great. I believer FARR circuits has the board and it only takes about 10-12 readily available parts.

From: jje642001
Topic: 186  Message: 186

I have an HP8920B that receives fine, but does not have any RF output at either the duplex or RF connectors. On a spectrum analyzer I can see the noise floor go up when the RF is turned on at the 8920. But there is no carrier present even with the level set at 0 dBm.

Is there a known failure mode? Has anyone else had this issue?

Thanks
je64

# 189. Upgrade 8924E to 8924C?

Yahoo group: hp8924
Date: 2010-07-28 18:15:35 UTC
From: wspx472
Topic: 189  Message: 189

There is someone on eBay advertising this upgrade. He says he'll do it for $150 plus $77.51 shipping. Has anyone had this done? I questioned him about the differences in front panel lettering and he said most don't have any problems using the added functions without the lettering being present. I have an "E" I bought for cheap mostly as an organ donor for my "C". Now, I'm thinking of converting the "E" and selling the "C".

I have'nt looked at ebay to see if it's the same guy but I bought a 60 watt kit off ebay a few months back. The kit consisted of a resistor block and a card with cal data. Installation of the block was fairly simple and the seller walked me through the cal upgrade on the phone. He wad a super nice and extremely knowledgeable guy. He even offered me a substantial core return via paypal after I sent the card back to him. The kit came with the high power sticker as well. I will try to look up the auction to see if it's the same seller that is on there now.

I uploaded a document showing exactly what you are looking for in the files section. I use a 100 watt, 20 db attenuator on my 3 watt 8924C.
You can enter the offset in the configuration menu. Just today I used it to measure a 200 watt Yaesu FT-1000D on 20 meters. By tweeking the offset, you can compensate for additional losses at 14MHz and measure the power accuratly.

I aquired two SRAM cards on Ebay with firmware rev. A.06.33. It's not the latest rev. but my 8924C would boot up with Beta firmware and for me, any revision higher was an upgrade. I'm wondering if you can just aquire 8924C firmware, would your "E" simply become a "C".

Why not replacing the battery?

I think it is not SDRAM but actually SRAM. SDRAM requires a complicated onboard SDRAM controller to retain the data, but SRAM just keep feeding in the power and it keeps alive.

Hi,

Thanks for your reply.

I don't know if the original built-in 60 watt/100 watt RF input works differently.

Your external approach should affect both input and output level by 20dB, but i just wonder if the original built-in approach just affect the input level. It is best to widen the input level without reducing the output level.

Thanks and Regards,
Dickson Fu

It reduces the generator level by 20 db but that's OK. When testing receivers, I don't need levels greater than -20dbm. I would think the 100 or 60 watt conversion would suffer the same losses. If I need 0dbm, I just remove the attenuator and recall the "Zero Offset" setup. I could be wrong but don't think you can bypass the 60 or 100 watt conversion.

# 197. 8924C intermittent power up problem.

Yahoo group: hp8924
Date: 2010-08-01 12:39:26 UTC
From: jayw_comark
Topic: 197  Message: 197

Hi all,

I have two 8924Cs that have an intermittent power up problem. (completely dead, no fan, nothing) It seems that when I take them apart to poke around, they will start working again. They'll stay working for days, but if left off for a week or more the problem returns. Hoping that this was a common problem with these and someone might know what the "fix" is.

Thanks.

Jay

# 199. Measure return loss and cable fault with HP 8924C

Yahoo group: hp8924
Date: 2010-08-02 18:53:26 UTC
From: Dickson
Topic: 199  Message: 199

Hi all,

I just discovered an Australian company "Measurement Innovation Pty Ltd" has made a Windows PC based software for HP 892x series radio service monitor for measuring cable fault location and much more.

http://www.measurement.ashop.com.au/c/25306/1/rf-tools.html

Demo on YouTube
http://www.youtube.com/watch?v=MUJaFbR8JK4

I guess they made the PC software that communicates with the HP 892x via the GPIB. The screen looks better and presents more sophisticated features than what 11807 Opt 100 offered.

Looks like it is more expensive than the 11807 Opt 100 software that only runs on the machine, but I wonder I can develop my own application using LabView framework becase the HP 892x series GPIB command protocol has made available on the web.

Thanks and Regards,
Dickson Fu

Hi Jeff,

Thanks. Poking around in the archives, I came across another post of yours:
http://groups.yahoo.com/group/hp8924/message/68

"Two electrolytic caps need to be replaced. The small one directly above the Green LED (1uf 50V) and on the second stand up baord adjacent to the green LED replace the 47uf 50V electrolytic. This is the one causing the supply not to turn on and click. I will get a photo and part location on the next one I work on. Be sure to apply heat sink compound to the heat sinks that attach to the top cover."

I found that the *second* board is actually 4.7uF, but the first board *is* 47uF. Since I wasn't sure which one to replace, I replaced all three. I am now going to leave them unplugged for a week or so and see if the problem returns. Curious that it takes so long before the failure comes back...

I'm working with the Prologix USB to GPIB adapter. You can Buy-It-Now on Ebay for $150.

I'm writing a Visual Basic program to control my 8924C but with the out door chores and the long days this summer, there isn't enough time to spend on the project. I hope to have it working this winter.

Porlogix's web site can be found at http://www.prologix.biz/

That is a pretty good deal. I have written them to ask if it will fully emulate the 82357A/B. I am interested in using with the RF Tools software by Measurement Innovation. They could not suggest a low cost alternative to the 82357A/B. My budget is somewhat restricted so hope it works.

Be sure to apply heat sink compound to the heat sinks that attach to the top cover."

I
found that the *second* board is actually 4.7uF, but the first board *is* 47uF. Since I wasn't sure which one to replace, I replaced all three. I am now going to leave them unplugged for a week or so and see if the problem returns. Curious that it takes so long before the failure comes back...

# 207. Component Level Information Packet

Yahoo group: hp8924
Date: 2010-08-14 16:42:38 UTC
From: MICHAEL SMITH
Topic: 207  Message: 207

Hi,

I am new to the group. I have scanned through the 200 and some messages, and do not see anything related to my question. I am looking for the Component Level Information Packet, basically the schematics and part list for fixing the individual modules. I just got a 8924c that has some issue on the Input circuit. As I scroll through the reference levels in the spectrum analyzer, it is not linear. I have compared the 8924c duplex output levels with a HP 8920 analyzer; it is liner and right where it should be. When I use a generated signal from the 8920 to the 8924, it does the same thing; the reference levels in the spectrum analyzer screen are not linear. I get 4 errors while do the RF self test, and it identifies the Input Assembly. I am assuming that someone stuck power into the antenna port. One of the errors is a +20 Attenuator, so from looking at the block diagrams and the 8920 Component Level Information, it seems like the U104 or U106 may be bad.

I would like to have the correct Component Level Information Packet, anyone know where to get it?

Thanks,

Mike / KB8WLW

I found the service manual on the net. I am not sure it would be any help but I have it if you don't. It is several hundred pages.

If you need/want it contact me off list and I will mail it to you but I believe I downloaded it off the HP/Agilent web site.

I have checked the assembly level repair document and it only tells you what module to replace. It does not tell you anything about component level details.

What I have is the
Assembly Level Repair
HP # 08924-90061
April 2000 Rev b
it is 613 pages

I think it came from the HP site so it is the same manaul. I am sure you can find it on the HP site or I or someone else could mail it or uplaod it. Since it is on the HP site I hate to take up disc space.

I have just skimmed throught it and not studied it so not sure exactly what is in it.

# 215. R29 value on power supply

Yahoo group: hp8924
Date: 2010-09-13 01:36:58 UTC
From: CW
Topic: 215  Message: 215

Dear. Gentlemen,

I bought used 8924C and found it need a time to powering up about 10~15min. It seemed bad capacitors on power supply. And I replaced few capacitors(C5, C10 & C11) on SMPS. Now I could resolve power on delay issue but I found R29 is discolored while I'm replacing capacitors because of too much heat. I couldn't read value on it. Does anyone advise me the value of R29?

Another problem is 1 min after power switch is pushed in upper side of CRT is wobbling for a while and display as normal. I think the CRT lights up late because of known reason. The CRT has stain on fluorescent material but working good once lights up. Does anyone has idea about this?

Any advise would be appreciated.

Thank you in advance.

# 216. RF Generator dead between 250 and 280MHz

Yahoo group: hp8924
Date: 2010-10-02 03:41:15 UTC
From: WA9FVP
Topic: 216  Message: 216

My 8924C developed a problem where there's dead spot between 255 and 280 MHz. I can see it in the spectrum analyzer when the tracking generator is on and there's no output in that range on the RF IN/OUT port or the Duplex port. There's a 250 to 500 MHz path where the 500MHz to 1GHz generator passes through a divide by 2, a modulator and a low pass filter on the A26 board. I'm sure the problem is on the A26 board. Has anyone experienced this?

# 217. Re:RF Generator dead between 250 and 280MHz

Yahoo group: hp8924
Date: 2010-10-02 16:21:00 UTC
From: Joe Leikhim
Topic: 216  Message: 217

I have noted that from a dead cold start; my 8920B will fail some of the manual RF diagnostic tests. However, the instructions for that test, recommend a 15 minute warm up time before running them, and so if I do this, the tests pass every time. if the tracking analyzer is tested in a loop test under those same cold start conditions, there will be a distinct notch in the vicinity of both 350 and 700 MHz until warm up. My analysis is that the VCO needs to be warmed up before it will lock properly at those frequencies. If as you suggest, there is a divide by two, then it is possible in your case that the VCO is unlocked from 500 to 560 MHz as well.

You might try to see if there is a VCO steering line voltage adjustment, usually a capacitor or inductor, to adjust.

If that were the case, there should be two gaps. I only see one, where the VCO is connected to the divide by 2. According to the repair manual, the generator is a straight connection to the I/O unit between 500 and 1GHz. Even after a few hours of warm up it's the same.

What manual are you using for the 8924 and 8920. Is it available on CD. If so where?

On the A24 module (the RF Generator) there's an adjustment called "VCO BIAS" With the 8924C in spectrum analyzer mode, tracking generator on, I adjusted the "pot" counter clockwise. The gap narrowed. After about 5 turns on a 10 turn pot, the dead spot was gone. I'm not sure what the adjustment is for, it's not covered in the manual. I checked the RF generator frequency and level at several frequencies and nothing changed. I was able to complete the CDMA_CAL Routines with no errors (see page 123 in the repair manual.

Assuming you pass all other self tests, the power supply voltages are nominal. It sounds like you were successful in tuning out some minor component drift and are good to go.

# 223. Using the Tracking Generator Offset

Yahoo group: hp8924
Date: 2010-11-20 18:11:33 UTC
From: WA9FVP
Topic: 223  Message: 223

I used my 8924C to adjust a PLL I.F. on a Yaesu FT-980. The adjustment requires a flat IF response using a sweep generator that sweeps beyond 5.3 and 5.8MHz.

There's a 38.0675 MHz reference oscillator that's mixed with 5.3 to 5.8 MHz to generate an IF frequency between 43.3675 and 43.8675 MHz.

Here's how I set up the 8924C.

Spectrum analyzer:

Controls/ RF In = Ant.
Center frequency = 43.6175
Ref Level = -10 dbm
Span = 7Khz

RF Generator:

Controls = Track
Offset Freq = -38.0675 (make sure it's a minus offset)
Amplitude = -10 dbm
Port/Sweep = Dupl. /Norm

I connected the duplex port on the 8924 to J1 on the PLL board (the VFO) input. I connected the antenna port to test point TP01 (the I.F. test point). The passband was displayed on the center of the screen and I was able to adjust the passband for a flat response.

The tracking generator sweep was between 5.19 and 5.9 MHZ and the spectrum display was between 43.2675 and 43.9675 MHz. I'm sure other combinations can be used to adjust a receiver I.F. or to test a mixer or other situations where an offset is needed.

# 224. 8924C ROM CHECKSUM ERROR

Yahoo group: hp8924
Date: 2010-11-27 15:15:15 UTC
From: jayw_comark
Topic: 224  Message: 224

Hello all,

Was wondering if anyone might know how to recover from this error. I've narrowed it down by swapping the CPU board from a known good unit, and the unit then works. I also tried swapping the socketed 28C256 EEPROM as well as the 27C010 PLCC, to and from the known good unit, and the problem stays with the CPU board. Based on this, I believe one or more of the four TSOP flash devices is corrupted. Looking through the service manual, it states:
"ROM Checksum Error
With the new firmware loaded into the Test Set's flash ROMs, the
checksum on the ROM is tested. A faulty checksum is most likely
caused by the flash ROMs themselves or possibly the controller circuits. In either case replace the A16 Controller assembly. "

I'm guessing that I need a firmware card to fix the unit, does anybody have a source for these or know otherwise how to recover? Note that this is a 6W max input unit.

Thanks for any assistance.

Jay

I have 2 firmware cards rev. A.06.33. More than likely your 8924C has a later revision. If you can use them I'll send them to you but I would like them back.

# 230. LMR setup

Yahoo group: hp8924
Date: 2010-12-09 03:01:45 UTC
From: rickc3204
Topic: 230  Message: 230

Hello, am new to group. Been using IFR 1200s for many years and now have acquired an HP-8924c. Unit is in good condition with new CRT.
Question is this..
Is there an easy way to set monitor up for servicing LMR? Without all the CDMA mumbo jumbo.
Example of Unit under test.
Yaesu FTL series 463.8 mhz, pl of 71.9
thanks in advance

From: WA9FVP
Topic: 230  Message: 232

You can use the DUPLEX screen to setup the LMR test.

Set the generator to the repeater's input frequency and the receiver/analyzer to the repeaters output frequency. The RF port connects to the repeater's transmit output. The generator is configured to the duplex port and connected to the repeaters input. On the DUPLEX screen don't forget to configure the receiver/analyzer to the RF port.

In the DUPLEX screen you can set up AF generator for the test tone frequency and connect it to FM at 4.5 KHz deviation but generator 2 will have to be configured on the GENERATOR screen for FM and the PL tone deviation.

# 233. HP8924C Randomly Turns Off.....

Yahoo group: hp8924
Date: 2010-12-28 16:54:05 UTC
From: Mike
Topic: 233  Message: 233

Morning all,
I have an HP8924C, and have started to experience an issue that is very annoying.

The Unit will randomly turn off and restart, or will also intermittently turn off when applying RF into the 100W I/O port.

.....And intermittently will turn on but not boot (Screen Remains Blank)

Has anyone run across this and a possible solution?

Here are the current specs on the unit.

Boot Loader: A.02.02
Firmware: A.08.02
Option: 601

# 234. RE: [hp8924] HP8924C Randomly Turns Off.....

I've recently had a problem with mine where if I switch it off it will randomly power itself on and off again. I temporarily solved it by leaving it switched on and powering it up using a power strip. When powered on, mine functions properly even with high levels of RF, so I'm not seeing exactly what you are. One day I'll tear into it and see what gives, but I'm happy with the work-around for now.

My first though was power supply, then I was stumped by the problem of applying RF to the I/O port. Now I am thinking power supply again. Suppose the power supply is marginal, and you are testing a transmitter on the bench that is itself pulling down the main AC power voltage? Could that be happening?

Sometimes my 8924C stays on when I turn to power off. I think it's caused by a worn or stuck power switch. When I press it on and off again, it turns off.

In the AF analyzer screen, ANL in is set to FM demod. I'm getting readings on freq error, fm deviation af freq, tx power... Filter 1 50Hz, Filter 2 15khz, de-emphasis off, detector peak+-max, settling fast, pk det to filters, scope to filters, speaker vol -Pot, speaker ALC-on, gain control-auto, input de-emph and notch gain to 0, notch freq. 1khz, audio in lo -gnd, ext -8ohm, AF cnt gate -10ms, dc current 0, To Screen -Analog with RX test, and config-config. In the RX test screen, if i config the AF gen to audio out, i am getting tone out of the audio-out connector to my o-scope, so that port is functional. If i change the tones frequency, it responds by changing frequency. For some reason, i cant get any FM demod, just tone. I get the startup beep from the front speaker, and i get the invalid beep, so the speaker i believe is functional. I owned an IFR1000S before this, It's acting like the internal/ demod to speaker is stuck on internal.

Do you the AF Anl In set to FM Demod? What screen are you in?

I ran the unit through all the self tests, all passed. AF test, RF test, CDMA test, internal audio paths, external audio paths, they all passed. The audio out connector works , I can send tone to my oscilloscope, I can change waveforms and are all correct, and I can adjust deviation, but i cannot seem to get FM demod to come from the Audio Out port, or get any audio (other than the startup beep and invalid tone) to come out of the speaker. The squelch knob gates the audio in the AF anl screen, volume pot has no affect on anything. FM demod makes it to the scope and the AF anl no problem. What to do next?

# 242. Re: [hp8924] 8924 no audio

From: MICHAEL SMITH
Topic: 238  Message: 242

I'm at work now and can not recreate your setup. But I wonder if there is a "POWERON" configuration saved that might be creating your problem. When in the spectrum analyzer screen, if width is set over 1.5 MHz the unit will not Demod. If you leave that screen and go to another screen, I have noticed that it won't Demod unless you go back to the spectrum screen and change the width or press the TX test button to enter that screen and then back to the screen you want. Of course all screens on analog mode.

Have you tried pressing "Preset" to reset everything and then reconfigure it?

From: CW
Topic: 243  Message: 243

Hello all,

I have 8924C and replaced some caps on PS board. But mine still does not show initial screen showing map with 8924C logo and self test message if I turn it on in a long time which means display comes up late. I usually unplug AC cord. What is possible problem? Is any body have circuit diagram for power supply?

My email is 'kirisame9@...'

Thank you.

My 8924C takes a bit to come up, about 20 seconds for the map pic to come up. That is normal, as it has done that since new. Then is operable within a minute. Are you sure the tube is ok? I had a worn tube in an IFR 1000S, and it took 4 to 6 minutes to show the display, where the monitor itself was locked and on within 10 seconds. Also, you can reprogram the PowerOn startup to make the map not show up, and behave exactly like an 8920. I'll try to hunt down my schematics...

Does the fan come on right away? If so, I would check the caps in the CRT assembly, or just re-cap it completely.

Hello, Rendy,

I appreciate for your update. Mine comes up late about 90 seconds or more when I power on at first time but cycling power the display will come up much fast. The tube seems OK once it completely come up. However I have burnt resistor on SMPS board which is R29. Do you know the value for it???

Thanks.

# 248. How Hot Should This Run

Yahoo group: hp8924
Date: 2011-02-04 20:22:19 UTC
From: radioman762
Topic: 248  Message: 248

I just decided to check the air outlet temperature on my unit. About an inch away from where air is blowing out on the left side, near the front, I am getting a reading of 110 degrees F. Room temp is in the mid-60's.

This seems a bit high. Any suggestions? I have thought of pulling off the covers and checking for dust.

Thanks.

# 249. RE: [hp8924] How Hot Should This Run

From: Ralph S. Turk
Topic: 248  Message: 250

Just make sure you do NOT run it with the fan shield off. This shield conducts the air through the PS which will burn up if the fan air stops. It takes about 120 seconds for the PS to get too hot.

I made the following measurements on my 8924 today.
Shop temp 60-62 degrees

Time 30 min 60 Min 180 min
Left side 70 78 80
Right side 62 67 68
Rear 60 64 64
Front Panel 72 78 78

All measurements made with a Raytek ST digital
ir temperature tester

From: zigs68@yahoo.com
Topic: 248  Message: 253

I did the upgrade a while ago (60 watt upgrade) and it took me about 30-45 minutes from what I remember.  What I got was an attenuation pad of a higher value than the 5 watt unit which you replaced on top of the heatsink that allowed you to read 60 watts of RF - and it could go to 100 watts supposedly but I never had anything over 60 watts to test it out.  They show the 60 watt units hanling 100 watts on some of the ebay sales so I guess it can do it.  You also got a calibration data card that you needed to upload the data from so that the 8924 knew it had the higher value pad installed and made the wattage values display correctly.  You even got a warning sticker to place over the RF input port that said 60 watts max instead of the 5 watts that was there.  No fancy soldering equipment needed for this - just a standard soldering iron did it. to remove and reinstall the pad.  And of course you nneded standard tools to take the case apart to get to the heatsink.

So far it has been working fine.  The interesting thing was that the heatsinks for the 5 watt model and the higher wattage model are the same - just the pad gets changed.  If this is the same ebay vendor doing this that I had the support was great.  If you had questions on uploading the cal data he talked you through it on the phone.

I used an external 100 watt, 20db power attenautor on the RF port and compensated the attenuation in the configuration menu. See the file "3W_300W_Conversion.pdf". I only paid $20 for the power attenuator.

Date: 2011-03-13 20:12:25 UTC
From: Mike, KD7MG
Topic: 257  Message: 260

No real schematics, just block diagrams, but the 8924C service/repair manual can be DL'ed direct from Agilent. Check out the first hit…

http://www.google.com/search?q=8924C+Repair+Manual

Yes, a set of schematics would be very nice, but I haven't run across any available (yet).

Cheers,
Mike

From: jimmyrtle
Topic: 261  Message: 261

Has anyone tried to measure return loss with a mini circuits directional coupler?

# 262. Re: return loss

Yahoo group: hp8924
Date: 2011-04-20 13:15:58 UTC
From: wb9oih
Topic: 261  Message: 262

Jimmy,
I have been using a Mini-Circuits ZFDC-20-5 directional coupler with the hp8924 with great success. This coupler is spected from 0.1 mhz. to 2 ghz. It has 20 db of coupling and averages 30 db of directivity across its range. It is a very useful tool for looking at antennas, cavities, filters, etc.

Mini-Circuits lists the price at $89.95 but I got mine on ebay for less than a quarter of that. YMMV.

Al,
K9SI

# 263. 8924C as an RF Sweep/Burst Generator

Yahoo group: hp8924
Date: 2011-04-21 01:23:16 UTC
From: willcoele@ameritech.net
Topic: 263  Message: 263

I don't know if you ever tried this but I used my 8924C as an RF Burst generator.

You can setup an RF burst or sweep using in the Encoder Button in the Analog Screens key group. In the Encoder screen, under Mode, select Func Gen. In the function generator screen under Waveform, you can select Sine, Square, Triangle or Ramp. Set the Frequency to 10Hz but you can tweek the frequency in the RF Gen screen.

In the RF Gen screen, turn off AF Generator 1. Turn on AF Generator 2 by highlighting the amplitude and select AM if you want a tone burst or FM if you want an RF sweep. If your doing an RF sweep, go back to the encoder menu and select Sine, Triangle or Ramp. If you want an RF burst, select Square.

When using a RF burst in AM mode, I adjust the modulation to 125%. In FM mode, you can sweep a maximum of 125 KHz.

You can sweep using the spectrum analyzer and the tracking generator but you can't ramp the frequency up and down using the Sine or Triangle function

# 264. Re: RF Generator dead between 250 and 280MHz

Yahoo group: hp8924
Date: 2011-05-03 01:35:44 UTC
From: willcoele@ameritech.net
Topic: 216  Message: 264

I posted back on Oct 1, 2010

>
> My 8924C developed a problem where there's dead spot between 255 and 280 MHz. I can see it in the spectrum analyzer when the tracking generator is on and there's no output in that range on the RF IN/OUT port or the Duplex port. There's a 250 to 500 MHz path where the 500MHz to 1GHz generator passes through a divide by 2, a modulator and a low pass filter on the A26 board. I'm sure the problem is on the A26 board. Has anyone experienced this?
>

Then on Oct 4, 2010

On the A24 module (the RF Generator) there's an adjustment called "VCO BIAS"
With the 8924C in spectrum analyzer mode, tracking generator on, I adjusted the "pot" counter clockwise. The gap narrowed. After about 5 turns on a 10 turn pot, the dead spot was gone. I'm not sure what the adjustment is for, it's not covered in the manual. I checked the RF generator frequency and level at several frequencies and nothing changed. I was able to complete the CDMA_CAL Routines with no errors (see page 123 in the repair manual.
>
>
Now it's back and I'm not sure if adjusting the VCO Bias will fix it.
I'm wondering if it's a bad electrolytic capacitor that's drying out.
Does anyone have any ideas or have you encountered the same problem?

Jimmy,
The first thing to do is to configure the 8924 for "duplex out" and "antenna in"and set up the tracking generator for no offset. To measure return loss hook the "duplex out" on the generator to the "out" connection of the directional coupler. Then hook the "antenna in" port to "couple" of the directional coupler. You can now establish the base line on the spectrum analyzer as this will show infinite SWR or minimum return loss. It should read about 20 db less than what you are generating. Once you've done this connect the load or device under test to the "in" port of the coupler. The space under the base line on the spectrum analyzer is the return loss in negative db. (Note: this may be counter intuitive to some but we're using the directional coupler to measure what's coming back as apposed to what's going out which is what the labels on it are for.)

At least that's how I've done it and it seems right to me. The caveat here is the accuracy of the load in the directional coupler which is an unknown but assumed to be 50 ohms and non-reactive.

There was an article in QST magazine several months ago which referred to this method so it has to be right, eh?

73,
Al, K9SI

From: EC Welch
Topic: 269  Message: 269

HI,

New to the group. Just bought a HP 8935/Agilent E6380A. How does this compare with the HP8924? My needs were .4 to 1000M, Spectrum Analyzer and Tracking Gen, and 60W dummy load. I know Agilent has a Manual download feature---How do I find it? All questions at this point---maybe I can contribute later.

Regards,

EC

Not sure about the spec comparison with the 8924, but the manuals you're looking for can be found on the right column of THIS <http://www.home.agilent.com/agilent/product.jspx?cc=US&lc=eng&nid=-536900811.536880769&pageMode=PL> page.

Cheers,
Mike

While not specific to the HP 8924c, Cushman put out some training manuals that can be found here:

http://www.repeater-builder.com/cushman/cushman-index.html

The manuals are towards the bottom of the page. They are a good general reference for doing things with any service monitor.

You might also do a Google search for your particular duplexer. Sometimes the manufacturer's tuning instructions can be found.

FYI - From the Repeater-Builder webmaster, concerning links to their various files, etc.

. * * * * * * *

. I'd appreciate it if you dropped a note on that group stating that

recently the repeater-builder group reorganized the test equipment section and all old links are probably bad.

(as you put it) drilling down from our top menu is probably the best way to find something (or using google - personally I put in a re-scan request when I add or change something)..

Topic: 31  Message: 281

The first file I uploaded (sg1842.pdf) is a "spec" sheet for the SG1843 PWM cintroller IC. On page 14 there's schematic that's similar to the 15v STBY in the 8924 power supply. The boost circuit consist of a 1n3612 and a 10uF, 20v electrolytic. The boost winding on T1 is an isolated winding that's referenced to the AC or "HOT" ground.

The PWM controller sub-board on the 8924 power supply is similar in that, it too is referenced to a "hot" gound. Becareful when working on that part of the circuit. DO NOT touch or connect an oscilloscope ground to any part of that board. The 15v STBY switcher is floating but I measured 160 volts from chassis ground to "Hot" ground on the sub-board. Before doing anything, even when the AC mains are disconnected, make sure that there's no voltage on the PWM board. There's a surface mounted, electrolytic capacitor just above C5. You can measure the voltage with a DVM from chassis ground to either side of the capacitor.

The second file are the specs for the BUZ80A switching transistor (Q1).

I use a red Moto mic shell with a new cord and mic element. I also used a new plug from Mouser that you'll find in previous threads. The element is sold on Ebay as a replacement for the Astatic D104 mic and works great on the 8924. Mic cords can be fount at www.thomasdistributing.com

If you're in S.A. mode and have the scan width set wider than a certain amount, I believe that is also one reason you might not get speaker audio.

The volume selection is always on "pot" and the span in SA is 2 khz. I've tried almost everything. The squelch pot gates the Frequency error in the AF analyzer screen, so squelch pot works... the speaker works, because it beeps at an invalid keystroke and at startup, absolutely no Demod.

I think it's a broken connection between the front panel and the A36 module. the beep is fed from the A16 controller module via an attenuator on the A36 module. Look on page 448 of the 8924C/E Assembly Level Repair manual (08924-90061). The block diagram clearly shows the connection from A36 to the pot. I removed the front panel on my 8924C a year ago and I remember that some buttons didn't work after I remounted the panel. I found that a connector on the front panel wasn't fully seated.

You can also check the "Audio Monitor" on the rear panel. If your getting it there then the problem is between the "Speaker De-emph and ALC" block and the audio output IC. The block diagram also show the pin numbers for connector J17. If you can probe the motherboard you can check for audio on the pins but without an extender board, I'm sure that's next to impossible to do.

Will
I saw your questions re audio out to the speaker.
As others have mentioned the Spectrum Analyzer must be set narrow..
One other thing has to do with the "Audio Analyzer" screen
Make sure after the 8924 boots you go the the Audio Analyzer
screen.
First entry is "AF analyzer In"
you MUST have it set for "FM Demod"
Normal boot is "Audio In"

Ok, Here's where I'm at. I have no audio from the aud monitor out in the rear. The SpecAn is set at .2mhz span, AF analyzer is set to FM demod. Volume is set to pot in the config screen. I can see the FM demod on the Oscope. One thing that had me wondering, When my 8924 boots, It starts on the CDMA call control screen, and the Call Status is -Transmitting- , average power of 17.7dbm.Is the CDMA side of the monitor interfering with the analog side? I'm sure it needs a new Lithium, because I cant seem to make it save any start up presets. Also, is it possible to make a preset to silence the monitor?

# 294. 8924C Audio Demod Problems.

Yahoo group: hp8924
Date: 2011-06-16 03:10:35 UTC
From: willcoele@ameritech.net
Topic: 282  Message: 294

Ralph, I changed the Subject of this thread to reflect that actual problem.

I setup an RF loop back on the Duplex screen and connected a BNC cable from the Duplex Out jack the the Antenna In jack. Fet the RF generator for FM with 4KHz od deviation. The RF analyzer is set to the same frequency, FM demod and Antenna input.

This ia a copy and past from the 8924 User's Guide.

---
AUD MONITOR OUTPUT
The audio monitor output provides an external output from various tap points in
the AF Analyzer.
Operating Considerations
☐ BNC
☐ Output impedance is < 1 kohm
☐ The Scope To field in the analog AF ANALYZER screen determines the source of this signal.
☐ The level is not affected by the front-panel VOLUME knob.
---

I trust that the "Scope To" field is set to "Filters". That's how mine is set. I'm seeing the demod on my bench oscilloscope. When I select input, the level drops and it appears that "AUD MONITOR OUTPUT" is connected directly to the "DEMOD AUD" line as shown in the block diagram on page 448. "DEMOD AUD" comes from the RF Analyzer block diagram. The other two choices are "De-Emp" and "Notch". The "De-Emp" level is normal until "750 us" is selected in "De-Emphasis" field on the "AF analyzer" Screen. Then the level from the "AUD MONITOR OUTPUT" jack drops.

Hopefully you see the same thing on yours.

# 297. 8924c power calibration fails

Yahoo group: hp8924
Date: 2011-06-16 21:09:59 UTC
From: jyelmgren
Topic: 297  Message: 297

having an issue on my 8924c
Looks like it is reading the input power low ...reads 4W instead of 5w for example.
Tried to run the power calibration routine and it fails either right away or about 50% through.

Power up test run clean and ran some of the other diagnostics without any failures.

Seems like it always has some input level on the RF in port as well if I just loop the duplex into the RF IN wiht a 0Mz offset ..like around -18dbm .
something flakey ( realy )on the RF input assembly ?

Jack,

I see the Demodulation on my bench Oscope as well. I followed what you did, I made a loopback in duplex, and ran the aud monitor out to my Oscope.However, Whenever I selected DeEmph on the AF analyzer screen, My -aud monitor out- level was not affected. When i measured the noise level outside of the notch, it was about .830mv.  So the monitor generates fine,receives fine, de-mods fine, and routes audio half fine. As well, Demodulation makes it back to the monitor out port. So my issue is either in the -de-emph and alc- block, or possibly in the speaker amplifier block, or in-between. Unfortunately i don't have an extender card to probe cards. I tried to reseat all the internal cards, but did not mess with the front cover. From here, I need to study the block schematic as well as which corresponding internal card to probe. Thanks for getting me this far.

I had the same problem with mine. I removed the "A5" RF casting and the 30 some screws on the top cover. There were four or five op-amps inside and one of them was defective. I don't recall the part number but I think it was an Analog Devices part. I didn't have a camera at the time and I didn't document the repair. This happened before I joined the group; otherwise I would have created a document and upload it to the files section. The opamps were close to the front of the casting and you can even trace where the RF enters and where the op-amps monitor the recified RF power. There's also a bank of terminating resistors that equal 50 ohms.

I remember feeding the cabling to the CRT such that I was able to place it on top of the 8924. I trouble shot the "A5" module while it was connected and fully operational with the top cover removed.

I discovered the defective part by measuring the voltage on all 4 outputs of the op-amp. One output was stuck either to the positive or negative rail but it doesn't matter which way. I checked the plus and minus supplies to the op-amp and determined that the output voltage of each section should be somewhere between -VCC and +VCC. I replaced it with a T.I., TLO64

The power measurement worked perfectly and I didn't even run the calibration.

The 8924C/E assembly manual was very helpful

Subject: Re: [Repeater-Builder] Cart Solution For Larger HP Service Monitors

Hi All
I built my carts out of old Grocery Store carts.
I cut off the front so I could have access to the second shelf
I cut a piece of 3/4 inch plywood to fit the trapezoid shape to form
a shelf for the top. I tilted the shelf to raise the front of the unit.
The shelf sits on 1 x 1 in Al angle that is bolted to the side and rear
I added a front reinforcement from a piece of 2 x 2.
I mounted a outlet strip to the rear of the cart.
I also added a slide out shelf just under the equipment shelf to hold small cavities etc
while tuning.
I built one for my 8924 and another for my 8935. They work great.
What I need to do is add a shelf above the 8924 cart and the 8935 cart
for the 15" B & W monitors that I use to make it easier to read when sweeping.

Subject: [Repeater-Builder] Cart Solution For Larger HP Service Monitors

I've never owned any service monitors over the years that didn't either fit on my service bench 17" risers, 30" standard bench tops, or on a scope cart. Recently I purchased one of the HP 89xx series monitors and I'm trying to find a workable solution to accommodate this behemoth in it's full 24" in the shop. Hangover on the rear isn't workable, not is a 6" front workspace. The best thing I can see is a suitable cart rather then building an extended bench. Perhaps there was even one made for this series or something that someone has found such as a food-service or lab cart that works ideally with these monitors.

Any ideas?

I use an audio visual cart purchased from a local high school surplus for $15.

It is a large rectangular cart with a shelf on bottom and one in middle. I have printer on bottom and drawer cabinet with accessories on middle shelf. It has large casters and rolls easily. It also has surge protector power strip on back.

I have seen tons of these at school surplus auctions. I have 4 in my shop with various types of equipment.

I've used an old Extron (RGB 109 or 118 if IRCC) standards converter originally intended to drive analog CRT projection TV's. Picked up on eBay for under $25, but some sellers still want too much for them. It feed the composite input on my 21" Dell LCD PC monitor. Great for just abount anything including CGA ond old Mac stuff.
I can dig it out and set up again if anyone wands specific info.

I've used an old Extron (RGB 109 or 118 if IRCC) standards converter originally intended to drive analog CRT projection TV's. Picked up on eBay for under $25, but some sellers still want too much for them. It feed the composite input on my 21" Dell LCD PC monitor. Great for just abount anything including CGA ond old Mac stuff.
I can dig it out and set up again if anyone wands specific info.

I would also be interested.

As I remember the 8924 output is composite so would this would be a composite to VGA adapter??

Hi Tony,
The Extron I used not a composite to VGA, It's a multistandard composite/RGB/digital/analog to analog RGB/composite (mono) converter. The 892x has a high resolution monitor running a 19.2kHz line rate and a composite (video & sync) output at that rate. Standard "TV" monitors run at 15.625kHz (625 line UK/CCIR/PAL) or 15.75kHz (525 line USA/RS-170/NTSC). This is quite different to the CGA to VGA or VGA to NTSC/PAL converters commonly available. Some monitors can be "tweeked" to run at the higher rates, but depending on the original desgin margins you can be stressing many components. I'll dig the box out this weekend. I've not used it since a house move.

Regards,
Robert G8RPI.

I have seen several converters on Ebay that advertise that they are composite to VGA. Apparently the Xbox games use a composite output and they need these to go to large screens.

I am looking into them to see if they will work. They are in the $50 to $75 range.

Hi,
I dug out the Extron setup I'd used before and it does not work. The sync is negative and my Dell needs positive. I can only think that I had it on a different monitor (it's over 3 years since I tried it) that had a true multisync input. Sorry to get your hopes up.
Iv'e ordered one of the ebay CGA/EGA/YUV TO VGA converters Item number: 260823902378. It theory it won't work because the spec says 14.5-16.5K, 23.5-25.5K and 30.5-32.5K but the 8924C outputs 19.2K. I'm hoping the chip will work with 19.2 as well. I've not been able to determine the chip set, so will "suck it and see". All these boards seem to be the same (there is a version with two outputs). The cased "professional" units cost 5 times as much. I will report on my findings.

# 317. Re: Video Monitor

Yahoo group: hp8924
Date: 2011-08-03 00:55:17 UTC
From: willcoele@ameritech.net
Topic: 129  Message: 317

I think it can be done with a simple circuit that extracts the horizontal and vertical sync pluses. The LM1881 is a sync separator IC that can connect to pin 13 (hsync) and pin 14 (vsync) of the VGA connector. The input to the chip is the composite video and the same signal can connect to pin 2 (green) of the VGA connector you can even use 3 switches to select all 3 colors. There's no reason why it wouldn't work. I remember years ago where a co-worker did something similar to a CAD work station monitor.

The LM181 can be found at;

http://www.national.com/mpf/LM/LM1881.html#Overview

Hi,
This will only work if the monitor can sync down to 19kHz. Standard VGA ones only go down to about 30kHz. A "multisync" monitor will work and many CAD monitors were multisync. That leaves two options a crude line doubler or a proper scan converter that stores each frame at one rate and then reads them out at the higher rate. The $50 units do this, it's just not clear if the will take a 19.2kHz input. An LM1881 or Extron may still be needed to extract the sync.

Robert G8RPI.

The LM1881 is a sync separator IC that can connect to pin 13 (hsync) and pin 14 (vsync) of the VGA connector. The input to the chip is the composite video and the same signal can connect to pin 2 (green) of the VGA connector you can even use 3 switches to select all 3 colors. There's no reason why it wouldn't work. I remember years ago where a co-worker did something similar to a CAD work station monitor.

Sure there is: You need to find a monitor that supports a 19kHz horizontal sync rate.

These were once (back in the days of CRTs) far more common than they are today, whereas regular old VGA with its 30kHz horizontal sync rate is primarily kept around because many computers still power-on in that mode... but very, very few people actually run their primary OS at 640x480 anymore!

The scan converter boxes/boards that people have been discussing contain a full frame buffer memory so that many different input video formats can be digitized, but then on the output side a standard mode such as VGA, SVGA, etc. can be used.

Geez, I remember when XGA -- 1024x768 -- was the "really high end" of display resolutions! Today 1920x1080 or so is the norm, and those with a bit more money to spend splurge on 2560x1600 30"+ monitors...

Hi all,
The CGA to VGA converter arrived and a quick lash-up shows that it works! see attached.
I bought ebay item 260823902378 which is a Gonbes GBS-8200 available from many suppliers.
http://gonbestechnology.en.ecplaza.net/catalog.asp?DirectoryID=239168&CatalogID=1631901
It requires separate video and sync. I connected the video to the green input and linked it to the sync input with a 0.1uF ceramic cap.
See attached photos (check "attachments" folder if you don't get direct mail)
A bit more work needed, but obviously the chip will sync to more than just CGA,EGA and component.

Robert,

Just a quick note of thanks. This is a wonderful development for all 8924 owners - especially those of us who have noticed the output of the internal monitor getting smaller as the years go by. I was even contemplating selling or trading mine because it was just so hard to see.

Thank you for documenting and sharing your findings with the group!

John / WB5NFC

Thanks John,
I'll work on the sync input and report back to the list. I just wish I knew what the chip was so I could get the full datasheet and spec. It's got a heatsink firmly glued to it so no chance of reading a number.

Robert G8RPI.

I don't understand your connections. Why is there a need to connect the video and sync together? Is the sync connection for the monitor or for the converter board? If there's a VGA plug on the converter, the sync connections should be provided by the VGA connector.

Most are LCD monitors are downward compatable. When your computer boots under the bios screen, it's displaying the EGA resolution.

99.9% of computer monitors built in the last 20 years (including LCD) will not sync much below 30KHz, which is just under the lowest VGA resolution. EGA is fixed at either 15.7KHz or 21.8 KHz, depending on the mode, which is definitely out of reach of today's monitors, as is the 19.2KHz signal that HP blessed us with.

As a side note, when VGA completely took over the CGA/EGA/MDA world in the late 80's and into the 90's, countless EGA monitors hit the bottom of dumpsters. Because of that, there was a time when "true" EGA monitors were fetching up to $400-$500 on eBay, because many were incorporated into things like CNC machines, and when a monitor would fail it was far cheaper to pay that price then to replace the whole machine. I have an older Techtronics Logic Analyzer built on an IBM AT platform that requires an EGA display. These sub-$50 converters (that Robert so graciously discovered for us), were designed to bridge that gap of using CGA/EGA equipment with today's monitors.

Now if we can just find a case these converters will fit in all will be good!

Mike, KD7MG

Hi,
It's composite video and sync on a BNC at the top left rear panel. The converter has four inputs, Red, Green, Blue and Sync. I connected the video directly to the green input and via a 0.1uF capacitor to the sync input. This is NOT ideal but quickly proved that the unit will work with a 19.2kHz input (It's not in the spec). I'll work on a better sync input when I get a moment.

Then the converter board has a sync separator. The sync input on the converter board must be a composite input. The composite signal has sync tips that are negative pulses and the duty cycle determines if it's a horizontal or vertical sync. The sync separator can sort it out and ignore the positive going video levels. On the other hand the RGB uses the video levels to establish luminance. There's no phase information therefore it's just a green picture.

My friend who's a video expert claims that the coupling capacitor should be 100uF not .1uF. But he's probably thinking of the NTSC standard where the frame rate is 30Hz. I assume the frame rate in this case is 60Hz.

You could probably connect all three colors to the composite output with a potentiometer. You could change the screen color but it would probably need a transistor circuit for each color.

Hi,
The board does not appear to have a sync separator in terms of video/sync separation. the combined V/H input is (just) capable of dealing with the composite signal it needs some more work. While the frame rate on video may be 30/60Hz the sync pulses are narrow so you do not need a large capacitor to pass just the sync. The point of the 0.1uF was to (in a very crude manner) high pass filter the signal so the fast sync pulse edges passed but the lower frequencies of rhe video did not.

Robert G8RPI.

Hi,

sorry to be pedantic, but it's not a separator. The input and output signals are at different rates and are not syncronised. The converter is a frame store. The input signal is digitised and written to memory at one rate, then read out at another and converted back to analog. The output sync is newly generated without reference to the input. Just because the sync input works with an ac-coupled video signal just means it's a versatlie input, not nessesarly a separator.

Regards,

Robert.

What is the impedance of the video out on the 8924. My first guess would be 75 ohms but knowing HP could be 50.

That's true but the board has to strip the sync pluses from the composate signal at the 19.2 rate, separate them into a Vsync and Hsync, Re-clock the two sync signals to the VGA rate and feed it to pins 13 and 14 on the VGA connector. Think of the 19.2 composite as a serial bit streem and the RGB, Hsync and Vsync as a parallel bit streem. A sync separator is a circuit that converts a serial bit streem to a parallel bit streem.

As I said before if a monitor can sync to the 19.2 rate you don't need all of that circuitry, just a simple sync seperator to convert it from a composite signal (a serial bit stream) to an RGB/hsync/vsync signal (a parallel bit stream).

OK,
Now find me a <$100 monitor that will sync to 19.2kHz. Ebay Item 180696788773 might but probably won't so I'm not going to buy one to find out. You can buy little 7" or less monitors that take VGA. one of these with or without a frame store might make an internal replacement.

Regards,
Robert G8RPI.

That's true but the board has to strip the sync pluses from the composate signal at the 19.2 rate, separate them into a Vsync and Hsync, Re-clock the two sync signals to the VGA rate and feed it to pins 13 and 14 on the VGA connector. Think of the 19.2 composite as a serial bit streem and the RGB, Hsync and Vsync as a parallel bit streem. A sync separator is a circuit that converts a serial bit streem to a parallel bit streem.

As I said before if a monitor can sync to the 19.2 rate you don't need all of that circuitry, just a simple sync seperator to convert it from a composite signal (a serial bit stream) to an RGB/hsync/vsync signal (a parallel bit stream).

Hi Tony,
It's 75R but not very critical.

Robert.

I got my board in and tried to duplicate what you did, but could not get it to work. I tried different values of capacitors, but only got an occasional “flicker” of the right picture, but it wouldn’t stay on. I’m going to look into either building a small op-amp sync detect circuit or maybe do it right and get an LM1881.

I DID get a beautiful picture when I fed the composite video into the “Y” port on the board, only the left-most part of the picture was cut off and I could not find a way to adjust it. Very close to getting what we need.

Hi Mike,
There is vertical and horizontal position and size controls available through the menu.
There is also a language selection including english.
I'll try the Y input here too.

Robert.

Yep, been there. On mine, the Position menu is only available when switched to the RGBS input. Too bad, because a little horizontal phasing touch up on the “Y” input and we’d be done.

[Attachment(s)<about:blank#TopText> from Robert Atkinson included below]

Hi all,
The CGA to VGA converter arrived and a quick lash-up shows that it works! see attached.
I bought ebay item 260823902378 which is a Gonbes GBS-8200 available from many suppliers.
http://gonbestechnology.en.ecplaza.net/catalog.asp?DirectoryID=239168&CatalogID=1631901<http://gonbestechnology.en.ecplaza.net/catalog.asp?DirectoryID=239168&CatalogID=1631901>
It requires separate video and sync. I connected the video to the green input and linked it to the sync input with a 0.1uF ceramic cap.
See attached photos (check "attachments" folder if you don't get direct mail)
A bit more work needed, but obviously the chip will sync to more than just CGA,EGA and component.

Hi Jim,
I used P3, green and sync. I chose this input as the supplied a lead. The lead has two identical connectors and is intended for use in video games (I repared these in the late 70's). I cut it in two giving two leads to work with. As I understand it, the board auto selects the active input.

Regards,
Robert.

I uploaded a photo in the Photos section showing my Monitor with the converter connected.

I couldn't get the any signal using the .1 capacitor and I was unable to open the Geometry menu. I was able to see something that looked a video signal with the horizontal and vertical hold control misadjusted when I set the screen resolution. For you youngsters, a Horizotal and Vertical control was something you had to adjust on your 1960's TV.

Nothing worked until I added an additional circuit but I might make some people mad! Using an LM393 comparator, a 20K trim pot, a 1k resistor and the .1 capacitor (that didn't work), I made a sync separator circuit. I adjusted the pot until I got the sync pulses on my oscilloscope. I have an Agilent DSOX2024 that has a video sync option and as soon as I adjusted the sync seperator, the scope locked in on the sync pulses. I connected my sync separator the the sync input on the card and everything functioned correctly. The set button allowed me to toggle through the inputs RGBHV, YPBPR and CGA and as soon as it selected CGA, the picture popped in.

So that the settings can be saved, does anyone know if one of the connectors is a battery backup?

Hi Will,
Great work. I don't know why mine worked first time with no sync separator. I just connected it and pused the autoset button.
Ias far as I can tell from online comments the settings are non-volatile (EEPROM or Flash). This makes sense as the boards are desigined to be fitted inside machines. Some users have reported that the settingins did not save the first time, but were OK on a later try.

For you youngsters, a Horizotal and Vertical control was something you had to adjust on your 1960's TV.

Nothing worked until I added an additional circuit but I might make some people mad! Using an LM393 comparator, a 20K trim pot, a 1k resistor and the .1 capacitor (that didn't work), I made a sync separator circuit. I adjusted the pot until I got the sync pulses on my oscilloscope. I have an Agilent DSOX2024 that has a video sync option and as soon as I adjusted the sync seperator, the scope locked in on the sync pulses. I connected my sync separator the the sync input on the card and everything functioned correctly. The set button allowed me to toggle through the inputs RGBHV, YPBPR and CGA and as soon as it selected CGA, the picture popped in.

So that the settings can be saved, does anyone know if one of the connectors is a battery backup?

# 349. Re: [hp8924] Re: Video Monitor - it works

Would you mind sharing a schematic of your sync separator circuit and its connections to the board?

thanks
Jim wd0ekr

Subject: [hp8924] Re: Video Monitor - it works

I uploaded a photo in the Photos section showing my Monitor with the converter connected.

I couldn't get the any signal using the .1 capacitor and I was unable to open the Geometry menu. I was able to see something that looked a video signal with the horizontal and vertical hold control misadjusted when I set the screen resolution. For you youngsters, a Horizotal and Vertical control was something you had to adjust on your 1960's TV.

Nothing worked until I added an additional circuit but I might make some people mad! Using an LM393 comparator, a 20K trim pot, a 1k resistor and the .1 capacitor (that didn't work), I made a sync separator circuit. I adjusted the pot until I got the sync pulses on my oscilloscope. # 352. GBS 8200 Converter - A few mods that are needed.

Yahoo group: hp8924
Date: 2011-08-13 04:26:34 UTC
From: willcoele@ameritech.net
Topic: 320  Message: 352

In my Schematic I show a the LM393 connected to a 5V supply. Do this instead! Connect the LM393 power to the on board 3.2v supply. I tacked a wire to R1, a zero ohm resistor near the crystal. Parallel a 50K ohm, 0603 resistor across C29 (Blue), C32 (Green), C33 (sync) and C36 (Red). For some reason the Chinese engineers cap coupled the RGB and sync to the ASIC inputs. Over time a DC voltage on the input will drift and the monitor will change colors and the screen will eventually fade. The capacitors are located in the row of components between the 3 pots and the asic.

While an op-amp approach will certainly work, I'm working on a solution using a $0.99 LM1881. It just needs 1 chip resistor and 3 chip capacitors to play. No pot to set, just assemble and go. Like others, I've been swamped and have had no time to put towards it. Hopefully soon.

Mike

Mike,

I thought of doing the same thing but I don't have an LM1881. I will try it in on a board that I'm planing that will have 3 video drivers and the sync seperator. For the most part, the LM1881 produces the same signal as my LM393 comparator. Internally the LM1881 has a comparator with an internal reference.

Will,

You're exactly right. The net result is the same sync waveform output. It's just the LM1881 allows for a cheap, "no fuss" solution. I was planning on making a tiny SMT "piggyback" PCB to handle the sync that would attach in an open area on the 8200/8220 board with a dab of hot glue. Total cost somewhere around $3.

OK, here's a silly question.
Anyone know what make/model connector P11 is (the 8-pin header right behind the "VGA"-style input connector) and/or what will mate with it? I've searched online quite a bit and found many that were close, but they were either too big, the keys wouldn't quite line up, or something else was wrong. Anyway, I would like to use that connector, if I can find the right mate for it.

Thanks,
Mike

# 360. GBS 8200 Some More Mods!

Yahoo group: hp8924
Date: 2011-08-14 22:23:09 UTC
From: willcoele@ameritech.net
Topic: 360  Message: 360

I noticed that after I added the 50K resistors and fed the composite into any of the three color inputs, there was a red, blue or green raster, that is, the background isn't totally black. I added a 33K resistor to ground on the ASIC side of C32. The 50K resistor is still in place. This changed the DC bias and now the background is totally black. You can use a 10K resistor but it will darken the foreground. Don't confuse this adjustment with the three pots. The pots are used to adjust the overall video level and have little effect on the background.

You could probably use a 50k or a 100K Pot with the CW pin connected to ground and the CCW pin connected to the 3.2v supply. Then the 50K, 0603 resistors could be removed. The pot can be used to adjust the black level.

Grrr. My board only included the big P3 (5-wire) cable and the 2-pin power cable, not any of the others. Guess I'll have to contact Gonbes directly and ask them what kind of @#$% Chinese connector they used. They sure aren't built around any "standard" Amp, Molex, etc. design that I know of. Nor are they carried by Allied, Newark, Jameco, Mouser, or any other parts houses that I searched through.

Mike

Date: 2011-08-18 02:25:21 UTC
From: willcoele@ameritech.net
Topic: 364  Message: 364

I found that this web page has a wealth of information.
It's geared towards the Atari Game computer but the
information can apply here.

http://info-coach.fr/atari/hardware/video.php

Sounds like might not be seated good and it having problems seeing all of the installed cards.

Yes, that was it! After reseating everything I still had the problem.

Then I found the key to decode the LED flashes and found the board. I deleted my post but it had already gone to the list.

Thanks for the help.

# 368. 8924C AUX Connector Pinouts

Yahoo group: hp8924
Date: 2011-08-26 03:44:29 UTC
From: willcoele@ameritech.net
Topic: 368  Message: 368

Does anyone have the pinout list for the AUX Connector. There's no information in any of the documentation.

# 371. Re: 8924C AUX Connector Pinouts

Yahoo group: hp8924
Date: 2011-08-30 23:43:32 UTC
From: willcoele@ameritech.net
Topic: 368  Message: 371

Hi Michael,

I already saw that in the Reference Guide. I'm looking for information on the other pins. I assume it's a DB15 connector but the only information they give is for pins 6 and 13. If I get time this weekend I'll pull my 8924C off the shelf and look at the connector. If it is a DB15, I'll make a breakout board and check the voltages. I'm looking for a way to power the GSB8200 using switched voltages from the 8924.

# 372. power supply R4 Value

Yahoo group: hp8924
Date: 2011-09-04 15:02:46 UTC
From: jyelmgren
Topic: 372  Message: 372

popped R4 on the main board while troubleshooting low voltage on the standby power supply.

R5 got covered in but looks OK and measures around 21K in circuit.

Thought someone had asked this but maybe it was a different group.

Anyway looks like it is a relatively low value in series with the main switching tranisistor (more or less)

From: jyelmgren
Topic: 372  Message: 375

The data sheet on the PWM IC has a schematic that is in the ballpark for the 15 volt standby power supply with couple of twists.

R4 is a 1 ohm resistor used for the current sense.

dropped a test probe while changing ranges which shorted the pins going to the upright PC board which popped a few other components as well as R4.

Good news is that it's all repaired along with the original problem ( bad caps on the 15v stnby PWM PC board ... typical )

All of the parts were at Digikey though the PWM they stocked was the commercial version and the 8924 had more of a mil-spec vintage.

The BUZ80A power FET is NLA (at least at Digikey ) but they had an equivalent in stock.

# 377. Used Monitor Assembly Available

Yahoo group: hp8924
Date: 2011-09-16 15:55:09 UTC
From: radioman762
Topic: 377  Message: 377

Good Morning,

I have recently replaced the monitor assembly in my 8924C. I had purchased a new one several years ago and finally got around to installing it when I did a general internal cleaning of the unit.

The old one is actually in very good shape, with some light burning of the screen which really isn't that noticeable, especially when it is running. It is nice and bright. But for the fact that I already had the new monitor and was well past any return date, I probably would not have changed it.

I would like to sell the assembly that I removed. It would be a definite improvement if you have a badly burnt or dim screen. Swapping out the monitor assembly is easy, but it does require removal of the front panel of the 8924C.

Please contact me off-line if you are interested.

FWB

# 378. 50 ohm or open circuit output

Yahoo group: hp8924
Date: 2011-09-24 14:31:22 UTC
From: Ralph
Topic: 378  Message: 378

I have a new (to me) 8924C and looking over the setup screens and manual for the 8920 (beter manual for non cell phone use).

In it there is a place to set the RF generator section for either output across a 50 ohm load or set it for open circuit voltage.

I know what this means and how it works. My question is what do I set it to so that it will put out the same as most other signal generators ?

The ones that I have used in the past do not have this option. I just want to set it so that it will put out the same voltage into a receiver that my other generators do.

For some reason I am thinking open circuit voltage is the way, but not sure.

# 379. Re: 50 ohm or open circuit output

Yahoo group: hp8924
Date: 2011-09-24 15:46:31 UTC
From: willcoele@ameritech.net
Topic: 378  Message: 379

I assume if you set it for open circuit, the level will drop by 3db. A 50 ohm load will do the same but in a high impedance circuit, there's no 50ohm load.

Most RF signal generators are calibrated into a 50 ohm load, so if you want to match their settings, that's probably where you want to run it.

# 382. 8924C Wrong RF Levels

Yahoo group: hp8924
Date: 2011-10-05 02:59:48 UTC
From: willcoele@ameritech.net
Topic: 382  Message: 382

While testing sensitivity on a 2 meter rig I discovered that my 8924C RF level is wrong. The 2 meter receiver spec is .18uV @ 12db SINAD but to get 12db SINAD, I had to increase the RF generator level to .38uV. I checked the receiver with my HP 8657B RF generator and .18uV measured 16.5db SINAD on the 8924C.

Here's what strange. If I checked the RF level with my Boonton RF power meter at -50dbm, both generators agree. There appears to be something wrong with the attenuator module below -100dbm.

Any Ideas, anybody?

# 383. Re: 8924C Wrong RF Levels

I had just received a 8924C a few weeks ago.  I asked a similar question as to which setting to use.
I finally hooked up an older signal generator and decided that the 50 ohm output was the one to use to match the older generator that does not give any options.  Out of several signal generators,  this one is the only one I have seen that gives an option.

Just the line I was thinking along too. I think the Marconi 2955 has a similar way of representing the voltage at the output. Could be to do with the voltage output un-terminated against a terminated output (50 ohm). Not sure why they do it but I guess they have a reason.

adding that the voltage under load (50 ohm) is often refered to as PD and the no load voltage is called emf which should be twice the PD.

I've experience of this years ago in the aircraft radio workshop. Some radios were specified with "hard" microvolts (50R sig gen) some with "soft". You had to read the spec carefully. If it was a "soft" radio you had to use a 6bB pad if your generator was hard. dBm is always "hard" so it's disapeared in obscurity. Old collins amatur kit was quoted soft so will appear to meet spec on a moden generator even if it's well down on sensistivity. Google "hard or soft microvolts"

Having hit the send button in a rush before work this morning, I did some more research (sorry, googling) and thought I'd got hard and soft the wrong way round.
Some recent sources were at odds with my description. However I found an early Booton reference < http://www.hparchive.com/Boonton/BRC-The-Notebook-03.pdf > that confirmed my memory.
"Hard" microvolts refers to a signal generator with a 50R output impedance, "Soft" or "Easy" to a signal generator with a low (0R) output impedance. I think the reversal came about due to non-RF amplifiers and power supplies being considered "soft" if their output dropped under load. The original RF usage was that it was "easy" to meet the uV spec with a low impedance generator as you did not get the  1/2 voltage (6dB) drop of a 50R generator in series with a 50R load. Stick wirth dBm!

Icom, Kenwood and Yaesu all use different ways of expressing RF levels, I'll upload PDF's to the files section taken from Excel spread sheets. They convert dbu to dbm. Yaesu uses measurements based 0dbu = .5uV and Kenwood uses 0dbu = 1uV. Icom's measurements are based on dbm.

I can't understand why it was calibrated at -30 dbm but at 1uV or -107dbm, the level was off.

Subject: [hp8924] Re: 8924C Wrong RF Levels

Hi,
That is because dBm is always "hard"  i.e. referenced to 50R. The output impedance selection only applies when you select a uV (or dBuV) output level. The selection does not actually change the output impedance, it just adjusts the actual output level by 6db compared to the indicated level.
Regards,
Robert G8RPI.

I can't understand why it was calibrated at -30 dbm but at 1uV or -107dbm, the level was off.

# 394. 8924E and sweeping a cavity

Yahoo group: hp8924
Date: 2011-10-24 12:01:24 UTC
From: ve3wva
Topic: 394  Message: 394

Hi guys! New to the group and service monitors in general. I bought an HP8924E off ebay last year and just getting around to trying to figure out how to tune my Phelps Dodge/Cellwave 564-4 duplexers with it.

I can get CLOSE... but still end up with some de-sense.

I have ONE HP attenuator 0-12dB in addition to the HP8924E.

My big question is

How to do you set up the 8924E to sweep a range of frequencies?

I would like very much to see the notch/bandpass.

I know how to get a signal out of / in to the service monitor, but the sweep function is killing me!

I ALMOST considered purchasing a SignalHound USB specan/TG but 1,700.00 is not in my budget right now! Plus I don't know if these USB things can hold a candle to what I already have.

Any help would be GREATLY appreciated!

Thanks in advance!

Rusty VE3WVA

Rusty
There are a few articles about the 8924 on repeater-builder.com and an
8924c group, as I recall, on Yahoo.com.
I found an excellent writeup on one of the 2 describing the used of the
8924c.
If I can find the ones I have, I'll send it to you.
The 8924 is one heck of a box. I use it for filters, circulators and
receiver alignment. The big thing is make sure its fairly accurate.
Desense could be caused by several different things. We just went
through it with our dstar and it turned out to be poorly made cables
from the xmt side to the cans and a short jumper to the hard line.
Use of the proper cables, high quality double shielded, is an absolute must.
Good luck.

From: Ralph Mowery
Topic: 394  Message: 397

You can go to the Agilent web site and download the information about the 8920b.  This is a similar unit and much of the analog information is the same.

Download the 8920 application guide and it will tell you how to set up the sweep generator.

You basically go to the spectrum analizer screen and with the cursor on the left side of the screen near the bottom, you push in on the knob and over on the bottom right you can select differant things.  Select the Main screen and there are two places to set up the sweep.  One if for the center frequency and the other is the total ammount of sweep displayed.  Say your cavity is for 150 mhz, then set the center for 150 and the range for about 2 mhz .

To really set the duplexer up the best you should use a retrun loss setup, but you can get close by tuning for maximum signals and tuning the notch.

While this artical is not for the 8924, it  may help you understand the tuning of the duplexers.
http://www.bird-technologies.com/products/txrx_manuals/7-9176.pdf

Make sure your connecting cables are double shielded going to the test set, and all the other cables in the repeter system are also.

Hi guys! New to the group and service monitors in general. I bought an HP8924E off ebay last year and just getting around to trying to figure out how to tune my Phelps Dodge/Cellwave 564-4 duplexers with it.

I can get CLOSE... but still end up with some de-sense.

I have ONE HP attenuator 0-12dB in addition to the HP8924E.

My big question is

How to do you set up the 8924E to sweep a range of frequencies?

I would like very much to see the notch/bandpass.

I know how to get a signal out of / in to the service monitor, but the sweep function is killing me!

I ALMOST considered purchasing a SignalHound USB specan/TG but 1,700.00 is not in my budget right now! Plus I don't know if these USB things can hold a candle to what I already have.

Any help would be GREATLY appreciated!

Thanks in advance!

From: Tony Brignole
Topic: 394  Message: 399

We had similar problems with leaky and poor quality fittings so we went to 1/4 inch Heliax and very high quality Amphenol fittings and this helped.

Subject: Re: [hp8924] 8924E and sweeping a cavity

Rusty
There are a few articles about the 8924 on repeater-builder.com and an 8924c group, as I recall, on Yahoo.com.
I found an excellent writeup on one of the 2 describing the used of the 8924c.
If I can find the ones I have, I'll send it to you.
The 8924 is one heck of a box. I use it for filters, circulators and receiver alignment.
The big thing is make sure its fairly accurate.
Desense could be caused by several different things. We just went through it with our dstar and it turned out to be poorly made cables from the xmt side to the cans and a short jumper to the hard line.
Use of the proper cables, high quality double shielded, is an absolute must.
Good luck.

From: Jleikhim
Topic: 394  Message: 400

1) having 3 or 6 db pads on the in and out cables of the test set can help normalize the impedance when tuning up.
2)the notch is most critical, requiring enough signal power and sensitivity to see the bottom of the notch. Sometimes tuning one cavity at a time rather than as a set is best approach.
3) your 8923 should be up to task if you use good double shielded cables and avoid adaptors especially poor ones.
4) if you are satisfied with tuning but still have desensitization, then suspect the antenna,transmission lines and jumpers
5) jumpers from RX and Tx should be double shielded and never clustered together on the rack. Run separately on opposite side rack rails with cable ties
6)measuring system desensitization is tricky, measure first into 50 ohm resistive load, if less than 1 db, then you are ok and should expect less than 1 db from the antenna unless outside noise floor is greater than 1 db in which case you have other concerns.

Thank You all for your input.

I have combed thru everything I can find on Agilent's website, repeater-builder.com and googled the crap out of it, but I am stuck. Nowhere can I find a walk thru on how to set-up the tracking generator/spectrum analyzer for sweeping a range of frequencies.

I can find LOTS of great general info on duplexer tuning, including this group, but I need a bit more specifics on this particular unit.

This project has absolutely consumed ALL (and then some!) of my spare time for the past 3 weeks... my wife and kids say "You DO exist!" when i come in from the shack at 12 - 1 am... I am hearing a 1kHz tone in my sleep!

If there is anyone on the list that has used an HP/Agilent 8924e (preferably)or an 892x to actually sweep a duplexer, to actually SEE the BP/BR trace on the specan... any kind of step - by - step guide on how to set it up would be priceless to me right now.

I have the duplexer tuned for the strongest BP signal and the weakest BR signal (I hope!) but I absolutely need to see it to be sure it's on the money.

I am hoping this unit (the 8924e and myself included:) can actually do it.

Thanks again to one and all!

# 402. Re: 8924E and sweeping a cavity

Yahoo group: hp8924
Date: 2011-10-25 04:43:24 UTC
From: Colin
Topic: 394  Message: 402

This is based on a HP8921A which I believe is almost the same as the HP8924E

Select the Spectrum Analyser
Under Controls select Main
Set the input to Antenna in
Set the required centre frequency
Set the required span
Set the Ref Level

Now in the Controls section, change to the Generator (I'm at work and not 100% if this is what is is labelled, it is the second option, the other 3 are Main, Auxiliary and Marker)
Select sweep (the generator can be fixed or sweep)
Select the output port to duplexer out
Select the RF level

As this port, the screen should be showing what you want.

You can select Marker under controls and move the marker around for frequency or level measurement.

If it still doesn't work, let me know and I will re-check this once I get home form work.

Thank you Colin....it,s after 1am here now so I will try this tomorrow!
I am currently not using the antenna port...guess I need to?

I did find a blurb about the analog rx test not being available from the front panel on the 8924e where it is on the 8924c....

I have to get some sleep, but I am very anxious to try your suggestion!

A thousand thanks!

I will let you know how I make out!

# 404. Re: [hp8924] Re: 8924E and sweeping a cavity

Yahoo group: hp8924
Date: 2011-10-25 06:24:45 UTC
From: Robert Atkinson
Topic: 394  Message: 404

Hi Rusty,
Colin has it nailed, certainly for the 8924C. Reading the difererences document for the 8924C versus 8924E I'm a little concerned about the lack of "front panel access" to the analog RF generator and duplex testing. This may be an issue for sweeping. If no one else has experience of doing this with an "E" maybe we can do a run through on the phone with me driving my "C" and you driving the "E". Not sure if you could get the functionallity back with a firmware update ( "C" ROM retrofit) to the E. Would have to look at differences in the sevice manual.

In short has anyone used the Spectrum Analyser and Tracking Generator on an "E" model 8924?

Robert G8RPI.

# 405. Re: 8924E and sweeping a cavity

Yahoo group: hp8924
Date: 2011-10-25 12:15:05 UTC
From: ve3wva
Topic: 394  Message: 405

Hi Robert
and many many thanks for your input and your offer on the phone call! maybe we should do that for sure.
In the positioning paper citing the differences between the two (8924e vs 8924c)

The HP 8924E does not have front
panel access to general-purpose analog screens such as:
· DUPLEX TEST
· RX TEST
· TX TEST
· RF GEN
· RF ANL
· ACP
· ENCODER
· DECODER

I am certainly encouraged by what they DON'T versus what they DO say... they don't say the RX test isn't there, just that there is no front panel access to it...

It's 8:10 am here and trying to get moving and get the kids fed & off to school. I will be out in the shack/shop within the hour.

So I will be at it shortly.

If there is anyone on list that has swept a cavity with an 8924E I would be grateful for their input!! I hope I didn't buy a proverbial boat anchor!

Being retired I have too much time on my hands. At least according to my wife.

I've been trying to find the writeup I mentioned to you earlier. I'm sure that you could get everything up and running with it.
Personaly I don't think using email helps. If you want I could call you at sometime and we could go over this step by step.
One of the first things I found to do was to setup the 8924 for ham use so that on power up the settings we need are taken care of.
This is done by setting up the parameters we need then using the blue key/config entering the setting into memory under the name poweron.
this now becomes your default setup.
By doing so when the 8924 boots up it will be in spectrum analyzer mode, tracking generator, output to duplex, input antenna, rf gen freq around 445mhz and so on.
When you say the front panel does not have access to certain functions, does this mean they don't come up when you press the button??
Later

Hi Rix

No it means the button isn't there on the 8924e.

Sounds great about customizing the startup on that unit... save me a lot of button pushing. I have a great guy in England offering to call me and walk me thru a few things too but it's getting a bit late for him to be up over across the pond now I think.

The step by step thing sounds great!

Do you have skype?

If not, I can call you to save your phone bill! If you email me directly with your phone number I will give you a ring when you are free.

My direct email (if you can't see it is my callsign @...

Thanks again! ve3wva is my call by the way!

MUCH APPRECIATED!!

Topic: 394  Message: 408

HOLY CRAP I CAN SEE IT!!

I switched the input to the antenna port and that seems to have done it!

I will let you guys know how i make out!

I would still like to setup the initial power on params... I will have a look at that and if I can't figure it out I will give a yell back on the list!

THANKS GUYS!

de Rusty

# 409. RF tools option

Yahoo group: hp8924
Date: 2011-10-25 23:41:26 UTC
From: Ralph Mowery
Topic: 394  Message: 409

Does anyone know where to find the RF Tool options HP 11807 option 100 for the 8924C ?

Ebay does not seem to have any for sell and other searches do not seem to locate it either.

There seems to be a company That makes some software called RF tools, but I think it is a similar software, but not the one by  HP.  That sells for $ 290 and is not worth it to me just to play with as a ham.
Most things that are done with the software can be done , just the tools make it simpler to setup.

Rick Bowman at Amtronix sells the RF tools option. It comes on an old style HP disc that the 8924 reads. I bought it several years ago and it is great. I have used it many times.

It is written in HP basic and is a little quirky to get used to but once you do it is great.
You can also get the 8924 or 8920 programming manual and write programs yourself if you are so inclined.

# 412. 8924C Seft test error help

Yahoo group: hp8924
Date: 2011-10-26 21:22:15 UTC
From: capt6d
Topic: 412  Message: 412

Recently I had an error when doing the RF Spectrum analyer tests on my 8924C and would like some info on what might be the cause. I could not find references to this in the manuals.

Below is the test result for the error.

```
RF Input Signal
Lower Upper Actual
Vertical Sensitivity (Vdc) (Vdc) (Vdc)
==================== ===== ===== =====
10 dB/div (Absolute) 1.645 2.176 1.631**
10 db/div (Relative) 0.640 0.960 0.660

** Failure Detected.
Suspect: Spectrum Analyzer Assembly (Medium)
```

1. What does the "Medium" stand for?
2. Is this more of a calibration issue rather than a hardware failure?

All of the functions of the unit work fine for what im using it for, DIY projects and stuff, no commercial applications etc.

Any info would be greatly appreciated.

Thanks

Jay

Hi Tony,
When you say an old style HP disk, do you mean a PCMCIA card or a floppy disc. If a disc, what size is it?
Any chance of a listing or a copy?

Robert.

It's a PC-MCIA memory card. The one Amtronix sent me with the RF Tools was Panasonic BN-512HSR-ND from Dig-Key It is a 512 Meg card.

I have been trying to find a way to copy it using the PCMCIA on my laptop but no luck so far. There are many cards of this type available on Ebay with this much or more capacity very cheap. The specilized software to read and write to it is fairly pricey and I haven't found any less that $100 so far.

The total cost if I remember was in the $100 range from Amtronix. It is well worth the investment. I also found an Eagle return loss bridge for $300 that works great up to 1.2 gig.

Try using a free program called Memory card explorer. I would love to have a binary file of the 11807 opt 100 stuff to look over.

Hi Chris,
Unfortunatly Memory Card Explorer is not a free programme. It's owned by ELAN (who make card readers) and is not cheap.

Being as the program is loaded into the Test Sets memory, it should be possible to remove the card and then copy the program to a new card. You might have to do this for each program. Another possibility is a laptop running Linux. The are a lot of disk utilities for Linux.

# 418. 8924c Memory card.

Yahoo group: hp8924
Date: 2011-10-30 19:21:20 UTC
From: Rix
Topic: 418  Message: 418

Is the pcmcia card for the 8924c proprietary or is it a standard card?
I purchased, probably misteakenly, a pcmcia to cf card adapter and plugged in a 2 gig cf card. But the 8924 doesn't seem to recognize it.
Would hate to spend money for another card but??.
Thanks much
Rix Seacord

I may be wrong, but I thought I read once where RF Tools is individually serialized for each HP analyzer that it’s purchased for. You might check into this, as I’m not sure copying it from one machine to another will do you much good.

Topic: 418  Message: 420

Hi,
The 8924C (and 8920B) take standard PCMCIA SRAM or ROM cards. The earlier testsets like the 8920A and 8922x use non standard cards. The 8924C does not know about FLASH memory but might read a card that has had an image of a ROM or SRAM card written to it on a PC. To format a card or save data on the testset you need a card that is true ramdom access, not block write like FLASH. These are battery backed up RAM cards. They don't have to be HP branded.

Is the pcmcia card for the 8924c proprietary or is it a standard card?
I purchased, probably misteakenly, a pcmcia to cf card adapter and plugged in a 2 gig cf card. But the 8924 doesn't seem to recognize it.
Would hate to spend money for another card but??.
Thanks much

Robert
Many thanks for the prompt reply. That really clears things up.
I located some cards on ebay that appear to fit the bill without
demolishing my bank account.
Assuming 512k is enough.
Thanks again

From: Ralph Mowery
Topic: 394  Message: 422

I think there may be some confusion on the RF Tools.  HP made a product called RF Tools option something or other.  There is another company that makes a product for the 8920 series of test equipment also called RF tools.

The other company does state it has to have the serial number.  They appear to be two entirely seperate producits.

I started all of this and was thinking of the one made by HP.  I am not about to pay around $ 300 for what that other softwear does for no more than I would use it.

Most of what the HP version does can be done with just a little thinking and a calculator.  I was mostly interisted just playing with the program.

I may be wrong, but I thought I read once where RF Tools is individually serialized for each HP analyzer that it’s purchased for. You might check into this, as I’m not sure copying it from one machine to another will do you much good.

From: radioman762
Topic: 424  Message: 424

I just completed installation of the 60 watt load that I had purchased a few weeks ago.

I have the data card but mislaid the instructions for using it. I have searched here but can't find anything.

I'd really appreciate it if someone could advise me of the correct procedure.

Many thanks in advance.

While not much to go on, here is a copy from the service manual page 81.

Downloading Calibration Data
Most assemblies in the Test Set require calibration data. To ensure that the Test Set remains calibrated after an assembly is replaced, new calibration data must be downloaded. When required, calibration data is provided on a PCMCIA memory card that is included with the replacement assembly. Refer to table 3, "Troubleshooting" on page 49 to see which modules require calibration data.
Calibration Data Download Procedure
1. Switch the Test Set’s power off.
2. Remove the faulty assembly.
3. Install the replacement assembly.
4. Switch the Test Set’s power on.
5. Insert the memory card.
6. Press the TESTS key.
7. Set the Select Procedure Location: field to Card.
8. Press the K1 key to run the test.
9. Follow the instructions on the screen.
10.Set the Select Procedure Filename: field to: DNLDCAL.

I put in the 3 watt to 60 watt upgrade option a few weeks ago and followed this.  Have to admitt that I got to a point and stopped twice before I told it to finish.

Here is the number of the manual if you want to download it from Agilent.

The other "RF Tools" program is made by a firm in Australia. It is a Windows program and you can get a demo for about $5 postage. It has a lot of nice features and for hams it is sold discounted with a limitation to work on one and only one test set. I am interested in the product for ham use, however the cost of the USB to HPIB interface is expensive. Apparently the software will only work with one specific and expensive HP interface.

# 429. Replacement Finger Stock

Yahoo group: hp8924
Date: 2011-11-12 23:01:20 UTC
From: radioman762
Topic: 429  Message: 429

In doing some cleaning and upgrades, I found that the finger-stock that goes between the bottom of the front panel and the chassis on my 8924C was damaged. Although I pieced it back together, it really needs replacement since portions were missing.

After I'd reassembled the unit, I was browsing through the latest Fair Radio Sales catalog and saw that they carry a couple of different types of finger-stock. Item number 97-555-02 appeared to be similar to what HP used. I ordered some, at $7.95 each, and they arrived today.

It turns out that this looks to be precisely what HP used. It even has the adhesive strip to hold it in place like the original. All that needs to be done is to cut it to length, since it is 24 inches long, and install it before remounting the front panel.

I don't know how critical having strip fully intact is to an RF tight unit, but HP must have thought that it was. When I get a chance, I will pull the front panel and install it. I will keep a spare in case I ever have to pull the front panel again, since I don't know how long it will be available.

I have no connection with Fair Radio Sales, other than being a satisfied customer.

# 430. Rear feet for 8924C?

Yahoo group: hp8924
Date: 2011-11-16 03:53:59 UTC
From: capt6d
Topic: 430  Message: 430

Would anyone here know where to get the rear plastic feet (If thats what the're called) for a 8924C?
I'm not talking about the four feet under the unit, These are the one's on the back that protect the bnc connectors when the unit is stood up.
I can't seem to locate any or find any info on other instruments that may have used the same part. I check ebay from time to time but all I see is the bottom feet.

I'm looking for a replacement for mine also. One of them got hit and its pretty badly broken, I wonder if this is a common problem?

I was considering making some for my instrument. I manage a small machine shop and we machine a lot of plastics. It wouldn't take much to carve these feet out solid blocks of Nylon or Acetal and then they would never break!

Once the machine is programmed to make a part it is cost effective to make a run of parts. If other people were interested I'd consider making them available to the group. Depending on the quantity run, pricing might get as low as $60 a set.

# 433. RE: [hp8924] Re: 8924E and sweeping a cavity

Yahoo group: hp8924
Date: 2011-11-21 12:03:44 UTC
From: Rusty at Manitoulin Island Computers
Topic: 394  Message: 433
Attachments: 1 described; binary payloads are missing from this source WARC

We are good, Rix! I was able to tune up my Celwave/Phelps Dodge 526-4 no problem (tho insertion loss is a TOUCH high; my calculations work out to 1.6dB & published specs are 1dB) and with a little more patience I was able to tune my Sinclair Q3220E; insertion loss on it is about .9dB.

I still have a touch of de=sense with either duplexer hooked up to a dummy load, there is no noticeable de-sense; hooked up to the antenna (2 different ones actually; the first was a Sinclair 310-c2; the second and current one is a Decibel Products DB408-4) I have a touch of de-sense.

My be an issue with my hardline Working on a home brew TDR to scope the line.

I appreciate you checking on me!

Here is a homebrew TDR that several of us have built here in Memphis. Original design came from Pat Lane (W4OQG) who is Technical Manager at WKNO here. Parts are readily available and total cost is around $10.

I used this quick cheap design for many years prior to getting a TEK 1503.

You need a pretty quick scope depending on how long your line is. I use a TEK 465 (dual trace 100 MHz) military model and it works great. You have to calculate distance by scope sweep speed and line velocity factor.

One thing we have used it for is to test impendance of unknown lines. You check line and then put pot on end and rotate so line termination at end is flat, then read resistance of pot and you will be line impendance.

# 435. Fwd: Item ICOM IC-Delta-100M (IC -Δ100M) for sal e on E-Bay

Yahoo group: hp8924
Date: 2011-11-22 04:17:42 UTC
From: Joe Leikhim
Topic: 435  Message: 435

I am currently selling an ICOM IC-Delta-100M (IC -Δ100M) Tri-Band 2m 70cm 23cm FM HAM RADIO on the E-Bay. The frequency capabilities are most suitable for the LEO FM satellites for V/U, UV, L/U and future L/V modes.

I will ship internationally.

Listing:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=160687355474

Thanks

Topic: 394  Message: 437

Hi Tony...
for some reason I can't see the attachment. I am very interested in seeing the circuit tho.
Can you try attaching it again?
Maybe it's my browser...

Thanks!

Rusty

# 438. Re: Rear feet for 8924C?

Yahoo group: hp8924
Date: 2011-11-25 03:32:26 UTC
From: capt6d
Topic: 430  Message: 438

I know i for one would be interested. I see a lot of these units on ebay missing the feet also. The last one I bought had both rear feet in perfect condition, that is until the seller wraped the thing in 1/2" PIPE FOAM for protection and shipped it UPS. The unit survived but the feet were in about 100 pcs. Never seen that type of shipping style before LOL!

# 439. Do all 8924c units have the same capabilities?

Yahoo group: hp8924
Date: 2011-11-25 15:41:49 UTC
From: tahrens301
Topic: 439  Message: 439

Hi Folks,

Newbie here. I'm in the process of peddling some of my test equipment to get an 8924c, but I have a couple of questions.

I found one for a good price on e-bay, and the guy has good feedback.

I asked him if it would do PL/DPL, 2-tone, etc, and he said that he didn't 'think' so.

Do all 8924c units have this capability, or are there some that are limited in what they can do?

Thanks!

Tim

BTW, if anybody is looking for an HP8590B let me know! :-)

The 8924C comes standard with many decode functions.

Look here for the differant units of the 89xx series.

http://www.amtronix.com/diff.htm

Standard- includes tone, 2-tone, 5-6 tone, POSCAG, LTR, EDACD, LPT1327, DTMF, DPL

It also decodes any single  audio frequency so it will do subaudio tones. It will also generate many of the tone modes.

I got one a few months ago for around $ 650 with $ 100 shipping.  It was either a 3 or 6 watt input unit.  Another person was selling the 60 watt upgrade for $ 200 with a $ 50 refund if you sent the programming card back.  I bought that.  The pixture on ebay is misleading as all you get is a small atteuniator chip, programming card, and a sticker. You have to remove the old one and solder in the new one.  There are only two places to solder and easy to do.
Biggest problem is there are about 50 screws to take out to get to the attueniator.

If you do not know about it, go to the Agilent site and download the manuals for it.  They will not be of much use to you.  Then download the ones for the 8920B or 8920 series.  Some of the buttons are labled slightly differant and are in differant places, but those manuals are more for the analog transceivers instead of the digital phones.  While the information is not exectally the same, it is close enough to be of a big help.

Subject: [hp8924] Do all 8924c units have the same capabilities?
To: hp8924@yahoogroups.com
Date: Friday, November 25, 2011, 10:41 AM

Hi Folks,

Newbie here.  I'm in the process of peddling some of my test equipment to get an 8924c, but I have a couple of questions.

I found one for a good price on e-bay, and the guy has good feedback.

I asked him if it would do PL/DPL, 2-tone, etc, and he said that he didn't 'think' so.

Do all 8924c units have this capability, or are there some that are limited in what they can do?

Thanks!

Tim

BTW, if anybody is looking for an HP8590B let me know! :-)

Hi Tim,
The 8924C is basically a 8920B in a bigger box with the high stability reference, spectrum analser options and CDMA digital cellphone functionalty added. You can find the product info here http://cp.literature.agilent.com/litweb/pdf/5968-4094E.pdf
It includes tone generation an decode. The list on mine is Tone sequence, DTMF, CDCSS, Digi-page, AMPS-TACS, NAMP-NTAC, NMT, MPT1327, LTR and EDACS. If this does not cover what you need, the built in BASIC controller and two tone generators allow you to do just about anything. There were no real hardware options for the 8920C other than the high power attenuator. This can be added or you can use an external attenuator. You can tell the test set what this is so the readings are corrected. You can't beat it for the money.

Robert G8RPI.

Thanks to all who have responded with such
good information!

I have one coming, and should be here next week.

I'm sure I'll have more questions!

Thanks again.

Tim

Rusty
Keep in mind desense can be caused by more than just a defective cable.
Much has been written on this subject alone.
Be especially careful about the type of coax used from the xmitr to the
cans and up to the antenna. We just ran into several cases of standard
coax, copper/AL shielding, causing desense along with bad solder joints
on uhf connectors. These were replaced with double shielded silver
plated coax. Problem gone. Expensive but it works.
Now if only I can fix my blasted usb/serial issue:-)
Almost forgot, did you check the length of the jumper cables between the
cans?
Good luck
Rix

Her it is!!! Please let me know if you get it. It works great and is easy to make. Please let me know if this comes through OK!!!

Hi Tony...
for some reason I can't see the attachment. I am very interested in seeing the circuit tho.
Can you try attaching it again?
Maybe it's my browser...

Thanks!

Rusty

# 445. Re: 8924E and sweeping a cavity

Yahoo group: hp8924
Date: 2011-11-27 19:38:44 UTC
From: Joe Leikhim
Topic: 394  Message: 445

I had a puzzling desense problem with a commercial low band repeater when used with TX-RX duplexers. The well known manufacturer used two of their mobile radio products in a repeater station along with a power amplifier. The problem as it turned out was a combination of out of band noise from the power amplifier in the HF, 14 MHz range, the out of band response of the duplexer at 14 MHz (Only 10 to 20 dB down) and the fact that the manufacturers mobile receiver used in the package FAILED TIA-603 spurious response rejection. I only figured this out when failing to see any on frequency noise at the receiver port, a light went on and I did some backward IM calculations using the local oscillator as a transmitter, the receiver IF frequency, and then the resulting "hits" I swept with a generator. The worst ones were in the HF band corresponding to a hump in the noise spectrum of the power amplifier. The repeaters were designed to fail and in talking to other customers, found they went through gyrations to make them work. I guess their mobiles worked because the low band base loaded antennas were not good HF antennas.

So before you get too worked up, get a very narrow bandpass filter and insert it between the receiver and the duplexer and make sure nothing out of band is upsetting the apple cart.

Tony,

Are there no more connections to the 121? Seems that there are some connections not made. (no Cx, untied pins, etc)

Thanks,

Tim

From: ve3wva
Topic: 394  Message: 447

Man am I thick or what? I still don't see an attachment... tried 2 different browsers and still don't see it.
Can you attach it to a regular email to my callsign @...? That would be great! I look forward to seeing it!! Thanks and sorry to be such a pain.

my callsign is ve3wva

Rusty

From: Mike
Topic: 448  Message: 448

What is the minimum IF bandwidth for the 8924C, and will it resolves SSB sidebands?

Tks miken, zl1bnb

It does demodulate SSB. Look in the demodulator options AM FM SSB etc.

From their spec sheet for the spectrum analizer.

Frequency Span/Resolution Bandwidth (coupled)
Standard:
Span Bandwidth
<50 kHz 300 Hz
<200 kHz 1 kHz
<1.5 MHz 3 kHz
<18 MHz 30 kHz
≥18 MHz 300 kHz

Hi Mike,
The selectable IF bandwidths are 15kHz and 230kHz. There is also a <20Hz, 50Hz or 300Hz HPF and a 300Hz, 3kHz, 15kHz >99kHz LPF or 6kHz BPF on the audio analyser. Also a notch filter and a bunch of specialist Call and CDMA filters. It has an SSB demodulator. I've also been considering building a quadrature downconverter for the 21.4MHz IF output to use 8924C as a front end for a soundcard based SDR.

Robert G8RPI.

I think what he is asking is wether the IF bandwidth (not resolution BW) is marrow enough to discriminate upper Vs lower sidebands. I do not believe this to be the case. A narrow BW of approx 2-3 KHz would be required.

My question is really about how useful the 8924c in spectrum analyser mode is in displaying upper and lower sidebands and carrier suppression, and for testing and adjusting narrow (cw and ssb) homebrewed crystal filters.

Hi Miken
At 300Hz RBW and 50kHz scan, the answer is yes, the 8924C has the resolution you need. It also has the tracking generator to provide the input. The biggest issue is any mismatch between the 50R impedance of the 8924C and your filters impedance. Unless you are designing the filter for 50R you will have to use some kind of matching network or buffer amplifier.

Robert G8RPI.

I think you should be fine with the spectrum analyzer. See if you can find the following or similar named document from Agilent website or elsewhere. 8920A_B Application Handbook.pdf

There are some inconsistencies in the manua as they assume your test set has a 60 watt attenuator internally for some tests which the 8924 normally does not have. You will need a dummy load and sampler, or a suitable attenuator for the transmitter.

# 458. Modulation Out?

Yahoo group: hp8924
Date: 2011-12-05 16:26:21 UTC
From: tahrens301
Topic: 458  Message: 458

Hi folks,

Is there a way to get demodulated audio out of the box?

Appears that the 'audio out' connector is only for AFgen1/2 signals.

Actually, I was playing with the box the other night... listening to a conversation on 40m SSB. (It does a great job of SSB demod... very stable too - a lot more stable than the Mot R2002)!

Anyhow, got to playing & tried to re-route the audio in the duplex mode to send it out on a 2m FM frequency into a dummy load. Purely as an exercise. Couldn't see how to get the audio path done.

Just curious.

thanks,

Tim

You might want to see if an assembly level service manual exists on the agilent site. If not the 8920B SM manual includes a simplified block diagram of the audio routing.

Rear panel - "AUD MONITOR OUTPUT".

I actually even used it to set up an ersatz Allstar repeater once.

Thanks Robert - found that output a little while ago. Guess I missed it first
time I scanned the back panel.

Hooked up a scope and saw the received audio.

Plugged it into the modulation input jack (right next to it), but
don't see a field that will let me select it (also mic) as the source of
audio.

I understand that this 'Modulation in' jack is tied in with the microphone jack on
the front. Do I need to 'key' the mic to allow this audio to flow?

Thanks,

TIm

# 474. External Attenuators for HP8924

Yahoo group: hp8924
Date: 2011-12-11 22:25:47 UTC
From: Mike
Topic: 474  Message: 474

Wondering what external attenuators folks are using with the 3-watt version of the -8924 when working with higher power radios.

With 15 dB of attenuation, I should be able to run ~ 100 watts, but obviously it's going to take some high-power attenuators. Eventually I want to install the 60 watt upgrade to the 8924, but will still have use for the attenuator(s) after that, so they won't go to waste.

Currently I'm using an iso-tee, but that means I can only run relative measurements, since the isolation of the iso-tee is variable.

I have a 20 dB 100 watt attenuator that I use with my 8921. I just
leave it inline and the box runs cooler. On receive the math is easy,
but the decimal point one place to the left.

Hi Mike and Mike,
You can tell the 8924C what value of external attenuator you are using and it automatically corrects all displayed values on the 8924C.

I've used two different attenuators. one is a 150W 30dB surplus unit that came from an analog cell phone base station. It has a  tab mounted stripline attenuator on a heatsink. The other is an old Racal 9102 Absorption powermeter which has a -36dB output.
As we are talking high levels of attenuation and don't need an exact value of attenuation, there is an other option. This is to use a 50R terminator (stripline or coax dummy load) as the input resistor in a L  pad attenuator or resistive tap. Obviously the grounded terminator resistor is the input side. Of note is the voltage across the series resistor. It is worth making this from two or three resistors in series to improve the voltage capability and reduce capacitance. No need to trim for an exact attenuation value, just measure it (with your 8924C) and enter the value into the 8924C.

Robert G8RPI.

# 478. Modifying internal 3W attenuator (Assembly A4)

Yahoo group: hp8924
Date: 2011-12-12 22:34:22 UTC
From: c_day_nz
Topic: 478  Message: 478

I have a standard 8924C which handles 3W max. I want to replace the flange attenuator inside unit A4 with a 20dB 100W H100NA20X4 Anaren attenuator. Can anyone confirm if the original HP attenuator is indeed 4dB? With the new attenuator fitted, do I just update the appropriate configuration screen with a 16dB offset? Also, given the new attenuator will handle 100W, will I be OK to measure 100W or would this exceed the test set input? Note my main use for the analyzer is testing / repairing / aligning HF SSB 100W & the odd 2m/70cm 20~50W FM gear. So super accuracy is not a key requirement.

AND a huge thanks to group members - I was able to repair my 8924C PSU and am part way through replacing the CRT with a TFT display. Only possible with help from this group.

Cheers & 73s
Chris ZL1CVD.

Hi Chris,

According to the manuals, it appears to be 4dB. Of course, you could always undo the two SMA connectors, and use the 8924 to verify that!

On the TFT display, are you pulling the composite video from the back panel? Sounds like a pretty nice addition.

Just upgraded to a 100w attenuator (replacement for the 3W), and it was an easy modification. I went to the trouble of pulling the front panel out, etc, but in the end, I think I could have done it all by just pulling off the top covers.

Tim

From: kb9jzy
Topic: 478  Message: 480

Hi Chris,

I'm expecting Santa to deliver a 8924C this Christmas.
One of her "elves" was asking about display repair. So, I guess
that means I'll have a bit of work to do.
I would PREFER to do a TFT conversion, rather than simply replacing the CRT. Which are getting harder to find and since have been in
some sort of storage, my guess is, like transmitting tubes, do develop leaks and other problems due to long term storage.

Where can I find the information and parts required to do this?
Any help, thoughts and ideas would be greatly appreciated.

# 481. Display repair: was Modifying internal 3W attenuator (Assembly A4)

Yahoo group: hp8924
Date: 2011-12-13 17:43:40 UTC
From: Robert Atkinson
Topic: 478  Message: 481

Hi Terry,
Don't know of a direct replacement module for the 89XX. However if you search the list you will find info on using a video standards converter designed for video games to drive an external VGA display from the 8924C's video port. As an option you might be able to fit a mini (7" possibly) VGA monitor in place of the CRT module.

HTH,
Robert G8RPI.

Subject: [hp8924] Re: Modifying internal 3W attenuator (Assembly A4)

Hi Chris,

I'm expecting Santa to deliver a 8924C this Christmas.
One of her "elves" was asking about display repair. So, I guess
that means I'll have a bit of work to do.
I would PREFER to do a TFT conversion, rather than simply replacing the CRT. Which are getting harder to find and since have been in
some sort of storage, my guess is, like transmitting tubes, do develop leaks and other problems due to long term storage.

Where can I find the information and parts required to do this?
Any help, thoughts and ideas would be greatly appreciated.

I would much rather repair the internal monitor/CRT vs. trying to engineer a new display solution.

The LCD/TFT replacements that are fully engineered are pretty expensive relative to the current value of the 8924c. Have not seen one for the 8924C yet either ( and doubt we will ).

The CRT's still seem to be available and the external adapter to VGA would be very effective for a bench solution. 8924c is too heavy for practical field use anyway.

Most of the time the biggest issue is the burn in on the CRT's but even with one badly burned in they are still very usable.

You might drop Rick at Amtronix a note if you need a new tube. I believe he routinely
replaces the tubes in the 8924c monitors. He may also have other parts if that's an issue.

I was looking at plugging in something to the back 'video out' connector, but it uses
a 19.2kHz sync rate (multi-sync), so my 'old' composite video monitors don't work.

I had a little 7" TFT LCD from one of those 'back of seat' type of DVD players, but
it's NTSC composite, so it didn't work either.

Yep, my tube also has some burn marks on it, but does it really matter, other than an asthetic
issue? Nah, probably not - I can still read it!

Good luck!!

Tim

Hi all
Santa came 11 days early here, but judging from the size of the 30 kg package, one of his elves now has a hernia. These hp8924c's are not light.

# 486. Using A TFT Monitor

Yahoo group: hp8924
Date: 2011-12-14 03:13:50 UTC
From: willcoele@ameritech.net
Topic: 486  Message: 486

I posted pictures in the Photo section of several modifications I did on the GBS-8200. I also added a few files in the files section. As soon as time permits, I'll generate a document showing in full detail the modifications and circuits needed to connect the GBS-8200.

The board is small enough to fit inside a gutted CRT frame but finding a TFT display and the hardware to position the display will be a challenge. The GBS-8200 will work with the 19.2 composite and I'm sure it's available on the original CRT connector. There are probably correct voltages that are also available to power the board and the TFT display.

The only drawback I can see is that the only control for brightness and contrast, will be on the GBS-8200. If you have a need to control the parameters, some how you will have to bring the buttons out to the 8924 front panel.

Hi Tim.
Yes, I thought it was 4dB but can't test it at present as my 8924 is in allot of bits. I sort of figured out the answers to a couple of my questions. 3W less 4dB gives 1.19W out. Therefore 100W in less 20dB gives 1W out which is under the 1.19W for the original attenuator. I did the mod last night, took a few photos and posted a pdf in the files section. Its pretty rough but should work for what I want. When I get it all up and running again I'll update the file with shots of the altered config screens that cater for the additional attenuation.

I did look at the eBay 100W & 60W upgrades that come with the cal data. But really can't justify the sort of $$ being asked. More so in that I think this 8924 has a few other faults that need sorting.

Cheers, Chris.

From: c_day_nz
Topic: 486  Message: 488

A couple of nights ago I lashed up the input of a GB8220 to the motherboard CRT connector J96. Got it to display OK until the 8924 had a hernia because I didn't have the A5 input module attached.

So now that I know I can use the signals from J96 to run the GB8220 OK I have ordered a 7.0" TFT + VGA driver board from eBay.

I will completely remove the CRT and use that space to mount the TFT VGA driver board & GB8220 converter board. As the TFT panel is only 5mm thick, I'll mount this on the front panel in the space occupied (165x120mm) by the original CRT display bezel (HP refers to it as MP41 - it unclips from the front panel).

The 7.0" TFT panel is 165x100mm so I'll have a narrow 165x20mm strip to mount control buttons (brightness, contrast, etc).

The only problem I foresee is supplying enough current to the GP8220, TFT driver board & TFT panel from the motherboard CRT connector (J96, pin 5, 12V). The CRT is internally fused at 2A but I'm not sure of its running current. I have read some eBay sellers recommending 4A @ 5V for the GB8220 alone. A quick test I did showed 400~500mA so maybe they are just trying to sell 4A 5v PSUs? I'd like to use the 12V on J96 but may have to resort to another option.

All this will have to wait until after the festive season now as were heading away for a nice family break.

Cheers, Chris.

Hi,
You should check your GBS8220 to see exactly what the power supply arrangement is. Mine had an onboard regulator that ran nicely from 7-9V unregulated dispite the "spec" saying 5V. If you do need 5V, consider using a switchmode regulator (National Semi "Simple Switcher" or similar) to drop from the 12V line. this will  approx. halve the average current on the 12V input compared to a linear regulator.
What sync separator did you use, a LM1881? Did you use just the green video input for a green display or all three for white?

Regards,
Robert G8RPI.

Yes, the CRTs are available but for those not in the US, they are quite expensive to ship. A 7" TFT can be made to work and will give a slightly larger viewable area (great for old eyes). For those of us who have limited bench space, a 7" TFT stuck to the front panel of an already large bit of kit may just be the solution. I'm not sure the modified result will ever look as good though

Hi Robert. It was a very quick lash-up with a 0.1uf ceramic cap. No mods to the GB8220 yet and I'm guessing this was why the video faded out just before the 8924 had a hissy fit (not display related ☐ A5 not connected). My GB8220 uses a BM1084 3.3V 5A regulator. Its not really a question of how to drop the voltage, more of how much current can I safely pull from J96 pin 5 before I blow a track. Also, my 8924 had a crook PSU (leaky startup cap as per list). I just replaced the one cap and haven't bothered testing all the others. Some of the frequency readings indicate the reference is drifting. So I probably need to go back to the PSU and give it a good working over. Even so, if I'm adding another 30~40W drain on the PSU, will it handle it over a period of time. I'll get stuck into all this in the new year and update the list as I progress. Cheers, Chris.

Greetings All,
Is there a LCD conversion available?
There is for some HP products.
Has anyone done this?
What is involved?

Appreciate the help,

Terry

looks like a good supply still available to the US ..roughly $200.00 wiht a quick search on Ebay. In the same price range as the parts to build an LCD display.
Lots of customization would be required with LCD around the mechanics and installation so a lot more effort than replacing the tube in my opinion.

So if you want a cool project the LCD may be fun but if you just want a functional piece of test equipment the CRT would be easier.

# 494. Re: Modifying internal 3W attenuator (Assembly A4)

Yahoo group: hp8924
Date: 2011-12-14 22:00:37 UTC
From: Bill Black
Topic: 478  Message: 494

Hi All

This group is at risk of going 'down under' with so many posts coming from NZ, so here is another one to help the cause ;-)

When installing a 100 watt upgrade I only had a 60 watt cal data card. Ric at Amtronix was most helpful explaining details of what to look for in the cal data file set.

So I was able to change the attenuation value in the cal data and now have an approximately calibrated 100 watt 8924.

What was needed is a cal data card and an HP100LX to edit the card data. The 100LX is an old HP handheld computer I had buried away that turned out to be compatible with the files used on the cal data cards.

From memory the original 3 watt attenuator is 6 dB, 60 watt is 14 dB.

I have a GN8200 card on the way so am interested to follow the comments on these and replacing the CRT with a TFT. Best guess is the CRT assembly draws at least 15 watts so using a switchmode regulator from 12 to 5 volts will allow nearly 3 amps without changing the main psu load.

Bill

Hi Bill
How well does the internal structure of a HP8924c deal with heat dissipation of up to 100 watts in such an upgrade?

I have a couple HP200LX and will be happy to copy an upgrade card and modify settings for the group if I can get a sample upgrade card.

Hi Miken

The attenuator is attached to a heatsink that is in the main cooling airflow from the fan.

There is some de-rating information showing how long and what power levels are supported but I don't recall the detail. It is along the lines of 100 watts for 30 seconds, 60 watts continuous.

The 8924 warns the operator if too much power is applied or the time at a power level is exceeded.

As mentioned in other posts there is a menu setting for offset if you are using an external attenuator or power sampler so the measurements indicated are for the radio side of the sampler or attenuator.

So with the right setup you can use the 8924 on high power transmitters. I think 100 watts is the highest you can go with an internal solution though.

A couple of people asked me to follow up my duplexer tuning videos with some more basic material. Here is a VHF receiver checkout using the HP E8285A test set. This equipment is very similar to the 8924C and 6380A, at least the general principles apply.

Transmit checkout video coming soon. I bet y'all can't wait :)

Do you know if the 100LX or 200LX can read the 8924, PCMCIA RAM cards?
I have my setups backed up and I need a way to read the cards. My HP Thinkpad has a PCMCIA slot but it won't read the card.

I can only vouch for the 100LX being able to read and write to a RAM card OK.

For installing the 100 Watt upgrade I got the cal files sent by email then transferred them to the cal card I had for a 60 Watt upgrade using my 100LX. The file with the cal information appears to be ASCII and can be easily edited with the 100LX to change the main attenuation value.

My guess is that it would be possible to identify and edit the rest of the data if you knew the individual attenuator characteristics.

There might be enough information around on the 100LX to work out what file system it uses and hence what the 8924 uses. I seem to recall DOS compatibility with the 100LX as they are similar vintage.

Hi Bill,
Any chance of posting the calibration data files and other information? One possible option for tranfering files is to use an external HP-IB disk drive. There are instructions on the 8924C for copying files from the PMCIA card to an external drive. Of course these external drives are not common, but I found this website http://www.hp9845.net/9845/projects/hpdrive/index.html which has an emulation program that runs on a PC. I've not tried it yet. There is also http://www.hp9845.net/9845/projects/hpdir/

Along the same line, has anyone tried to replace the old PCMCIA card with an adaptor that allows you to use a more modern storage system. Such as a compact flash card.
Such as this ebay item.
320812394613

It may be possiable to transfer the files to the compact flash memory chip and then put it into the adapter for the 8924.

Hi,
The 8924C won't format or write to a flash card even a PCMCIA one. This is because Flash is a "Device" card not a "Memory" card. Flash requires block writes and cannot handle bytes. It might read a flash card if you could write an image copy of a SRAM card. I've not tried this though.

Robert G8RPI.

Hi Robert

Files posted in a new directory in the files section.

I only got so far into what can be done. Was lucky to have the HP100LX that could work with the cal card but understand the 8924 will work with ms dos files as well as HP's own LIF format.

The calcard I used was borrowed so I no longer have the ability to experiment further.

Are you aware of this software http://www.measurement.net.au/c/25306/1/rf-tools-software.html And they have a GPIB to USB converter.

Keep us posted on what you are able to do.

Seasons greetings to all

Bill

Hi Bill,
Thanks for that it's very useful. I've had a quick play with a SRAM card and a CF card in a PCMCIA adaptor. I put ELAN's Memory Card Explorer (MCE, trial version) on an old windows laptop. It will copy a binary image to the CF card, with warnings that it is a "device" not a memory card. However the 8924C does not recognise the card. Now CF does have a memory mode as well as the Device ATA mode. The Adaptor seems to force it to ATA mode. It may be possible to get or modify a CF to PCMCIA adaptor to force memory mode. I've not looked into this and the CF may be too slow anyway. So you need to use a SRAM card or possibly a EPROM or Linear FLASH. You need 512K for the 11807E opt 100 software.

Regards,
Robert G8RPI.

I actually ended up just using a laptop with a PCMCIA slot and Windows XP. had a couple of laptops kicking around that I had to have XP for anyway that still had a real serial ports ans a PCMCIA slot.

Just used WinImage to extract the files from the 11807 image to a formatted 1M SRAM card.

Looks like it worked great ...little slow though. Guess I'm used to faster processors.

Picked up the SRAM card on Ebay,( need a least 512MB ) WinImage is a free download.

There is SW out there for later OS versions but all that I found were fairly costly for a one time use.

The HP Palmtops work but downloading the files via RS232 is a pain.

John

Hi everyone!

I plan to use my 8924C with an external 30db attenuator which I just bought. My 8924C is the 6w version. Does anybody know how much maximum power handling this will give? How to calculate this? Thanks and happy new year :).

Darrell,

6W plus 30dB = 6000W, but I suspect your attenuator has a much lower power rating.

Quick conversions for power:

3 dB = twice (or 1/2) the power - example 3 dB more than 2W = 4W

10 dB = 10X (or .1X) power - example 10 dB more than 20W = 200W

Hi Darrel,
At 30dB it depends on the power rating of the attenuator you have bought (up to 6kW). if the attenuator is rated for 25W you can use up to 25W. Conversion is easy, The 8924C will read 1mW for 1W in so if the 8924C says 12.6mW the power into the attenuator is 12.6W.
What model attenuator did you buy? Do you have he specification for it?
If it's not large and finned it is unlikely to be able to handle more than a couple of watts.

Regards,
Robert G8RPI.

Thanks for good replies :). Robert, I bought a 50w Bird unit. I already had a similar 3db 40w unit which works well so I decided to gain more power handling.

Former service monitor was a Motorola R2014D so I'm somewhat new to the HP but I'm quite impressed. Had I known I would have bought one years ago :).

Anyway, thanks again. When the attenuator arrives I'll tell the 8924C about it and all should be well :).

If you have the 8924 or 8920 series, there is a fellow that sells an internal HP attenuator  rated for 60 watts continious and will take about 100 watts for 10 seconds for about $ 150.  He has it listed for about $ 200, but you will get a $ 50 refund if you mail him the calibration card back.  Takes about an hour to install it if you take your time.  Mostly about 50 screws to take out to get to it.  The picture on ebay is misleading.  All he sends for this is a item about the size of a postage stamp and thick as a nickle..  You take out two small screws and unsolder 2 wires, and replace the chip and solder the two wires back.  That takes abotu 2 minuits.  Very easy to get to once all the shielding is off.
He does send the replacement lable that states it is now a 60 watt unit and a calibration card.

For the DB rating of what you have, every time you add 10 db,you get 10 times the power multiplacation.  That is 10 db will make a 6 watt unit 60 watts, 20db to 600 and 30 db to 6000 watts.  So unless your external unit is rated for 6000 watts or more, what ever it is rated for will be your limit.

I do not think there were any instructions with it.

It is not difficult to install.  I did take some pix of the install of the attenuator.  If you would like to see them, let me know and also if you have a high speed connection or dialup.  I do not like to send large files to people with dialup without them knowing about it.

After you get the case off and the top shield, look near the CRT section and you will see a small box ( about 1 inch by 1 1/2 inches) with some small hardline going to it.  Looks to be like about 1/8 of an inch.  Forgot what it is called rg wise.

Do not do like I did and drop one of the screws inside the 8924 and had to go fishing for it..

YOu install the attenuator and then turn the set on and put the card in the slot and do a simple upgrade.  I have forgotten the exect steps.  That just tells the 8924 you now have a 60 watt unit and adjust the internal calculations for it.  The data stays in the 8924 and you can then send the card back.

If you got it from rfe-toys on ebay there will be a phone number on the data card to call should you have problems.
Also a service manual is very helpful for dis-assembly. Start on page 83 and go from there.
I just installed the 100 watt attenuator, which required removing the attenuator.
Soldering in a new pad should be pretty easy.

Don

After all the "Tinkering" it finally works! I was able to save the cards into a file and using a hex editor software, I was able to verify the contents. Because I can maximize the window, the hex editor is better than MCE for viewing the file. The only thing I didn't like about MCE is that you have to turn off write protect in order to read the card.

If you have a newer version, upload it to the files section and to save space, I'll delete my files. As time permits, I'll update "My Analog Settings". This file is a collection of presets that I use for my 8924C. You might find them useful but remember, I have an external power attenuator. If you have a 60 or 100 watt unit, in the Configure menu, turn off the RF Level Offset and save the setting.

# 532. HP-8924C 60 Watt Upgrade from eBay

Yahoo group: hp8924
Date: 2012-01-08 22:56:08 UTC
From: Mike (WM4B)
Topic: 532  Message: 532

I installed the new attenuator from the eBay 60-watt upgrade kit today, but can't seem to get the calibration data uploaded.

When I go to the TESTS menu, and set the 'Load Test Procedure' to 'CARD' and the 'Select Procedure Filename', it appears that there is nothing on the card. At the top of the screen, it says " Error 85 During Procedure Catalog"

I've got message in to the eBay seller, but sure would like to get this figured out so I can get the test set running again.

73,

Mike

This is out of the service manual.  Did you press the K1 button after setting Loction field to Card ?

Downloading Calibration Data
Most assemblies in the Test Set require calibration data. To ensure that the Test Set remains calibrated after an assembly is replaced, new calibration data must be downloaded. When required, calibration data is provided on a PCMCIA memory card that is included with the replacement assembly. Refer to table 3, "Troubleshooting" on page 49 to see which modules require calibration data.
Calibration Data Download Procedure
1. Switch the Test Set’s power off.
2. Remove the faulty assembly.
3. Install the replacement assembly.
4. Switch the Test Set’s power on.
5. Insert the memory card.
6. Press the TESTS key.
7. Set the Select Procedure Location: field to Card.
8. Press the K1 key to run the test.
9. Follow the instructions on the screen.
10.Set the Select Procedure Filename: field to: DNLDCAL.

I installed the new attenuator from the eBay 60-watt upgrade kit today, but can't seem to get the calibration data uploaded.

When I go to the TESTS menu, and set the 'Load Test Procedure' to 'CARD' and the 'Select Procedure Filename', it appears that there is nothing on the card.  At the top of the screen, it says " Error 85 During Procedure Catalog"

I've got message in to the eBay seller, but sure would like to get this figured out so I can get the test set running again.

Yes. I get two very quick beeps and two errors. The first says ‘IBASIC ERROR 256 PROGRAM ROUTINE ERROR’ (this happens VERY quickly… had to run it about 50 times to finally see it all) and the second says ‘ERROR 53 Improper File Name’.

I really think the PCMCIA card is either blank or bad (or perhaps the wrong one… it had ‘100 watt data’ written on it in marker and it is crossed out and changed to ’60 watt data’ It also did not have the Write Protect enabled, so maybe the last guy to use it overwrote it. I also noticed that it has an ever-so-slight bend in it; I wonder if it got damaged when the Post Office ran it through the machines.

This is out of the service manual. Did you press the K1 button after setting Loction field to Card ?

Downloading Calibration Data

Most assemblies in the Test Set require calibration data. To ensure that

the Test Set remains calibrated after an assembly is replaced, new

calibration data must be downloaded. When required, calibration data

is provided on a PCMCIA memory card that is included with the

replacement assembly. Refer to table 3, "Troubleshooting" on page 49 to see

which modules require calibration data.

Calibration Data Download Procedure

1. Switch the Test Set’s power off.

2. Remove the faulty assembly.

3. Install the replacement assembly.

4. Switch the Test Set’s power on.

5. Insert the memory card.

6. Press the TESTS key.

7. Set the Select Procedure Location: field to Card.

8. Press the K1 key to run the test.

9. Follow the instructions on the screen.

10.Set the

Select Procedure Filename: field to: DNLDCAL.

Bought a 100 watt kit from him a few weeks ago.
I believe he probably has a phone number (on the card) to call if you have troubles.
I struggled with getting the new CAL data loaded since I'm new to HP products. I called Dan on the phone and he was very helpful.

Does sound like your card is possibly corrupt though.
When you go to "select procedure filename" you should see a list of files on the lower right.

Thanks Don… I thought there should be a list of files there. That’s the way it looks when I select ‘ROM’… figured it’d look the same with the card.

I’ll call him tomorrow… don’t want to bug him on Sunday night.

I ordered one from him a couple of months ago.  Came in  the mail in a few days and works fine.  I think it was about $ 200 with a $ 50 rebate if you send back in the programming card.  He has several of them.

The information show on ebay is sort of misleading.  All you get is a small atenuator chip about the size of a postage stamp and thick as a couple of coins.  After sending back in the programming card, he credited me back about $ 50 on my master card.

I took some pix of the instalation and if you do not mind large files, I can send them direct.

From: Mike (WM4B)
Topic: 532  Message: 541

Me too… no worries. I really suspect the card is either blank or bad.

Stuff happens and thankfully I'm not hurting for the test set right now. (If I were, I'd put the old attenuator back in.)

73,

Mike

I installed the new attenuator from the eBay 60-watt upgrade kit today, but

can't seem to get the calibration data uploaded.

When I go to the TESTS menu, and set the 'Load Test Procedure' to 'CARD' and

the 'Select Procedure Filename', it appears that there is nothing on the

card. At the top of the screen, it says " Error 85 During Procedure

Catalog"

I've got message in to the eBay seller, but sure would like to get this

figured out so I can get the test set running again.

73,

Mike

# 545. Controlling the 8924 via serial port

Yahoo group: hp8924
Date: 2012-01-15 00:13:32 UTC
From: willcoele@ameritech.net
Topic: 545  Message: 545

I was able to find a control code to execute commands via the 8925 serial port #9.

When you send a Control "[" (left bracket) using a common terminal program the 8924 will send back "SC-" I tested this using the terminal emulator in the BTS software and I found that if you press letter key after the control code, the 8924 will respond to a command. For example, lets call Control Left Bracket "CLB"

CLB A Displays the message screen
CLB a Displays the RX Test screen
CLB E Starts the screen capture
CLB e Displays the Test Screen.

If you use Hyperterm, you can setup "Hot Keys" control the 8924 remotely but I don't have time to log check every command and I don't think there's any documentation from Agilent. If your interested, you'll have to figure it out yourself. When time permits, I'll work on a Visual Basic, GUI program.

That sounds great! Do you need a null modem between the 8924 & the PC, or just a straight cable?

The command may be the same as if you were using the HPIB port. Its just that they come in via the serial port instead of the HPIB.

Actually the HPIB commands require a syntac. The serial commands are one letter commands. For example the numbers 1 thru 10 is the same as pressing the user defined keys. Numbers are entered using CLB q thru p.

Connecting the serial cable is in the users manual.

# 549. RE: [hp8924] Re: HP-8924C 60 Watt Upgrade from eBay

Yahoo group: hp8924
Date: 2012-01-15 05:54:29 UTC
From: Mike (WM4B)
Topic: 532  Message: 549

Got the new calibration data from the seller yesterday and got it uploaded. Seemed to go okay this time.

Tonight I was playing with the instrument and connected my signal generator to the -8924 Spectrum Analyzer input. With the signal generator set at 0 dBm, the Spectrum Analyzer showed about -13 dBm. I followed this up with a loopback test (-8924 duplex out to antenna in) and go pretty similar results. The delta tracks at about 13 dB regardless of the setting of the generator output or frequency. Several different cables were tried.

What the heck is going on here? I'm starting to feel pretty well hosed over this entire 'upgrade' deal. I'm about ready to put the old attenuator back in, but without calibration data for it, I'm still out of luck.

Have lost my mind?

73,

Mike

Subject: RE: [hp8924] Re: HP-8924C 60 Watt Upgrade from eBay

Got the new calibration data from the seller yesterday and got it uploaded. Seemed to go okay this time.

Tonight I was playing with the instrument and connected my signal generator to the -8924 Spectrum Analyzer input. With the signal generator set at 0 dBm, the Spectrum Analyzer showed about -13 dBm. I followed this up with a loopback test (-8924 duplex out to antenna in) and go pretty similar results. The delta tracks at about 13 dB regardless of the setting of the generator output or frequency. Several different cables were tried.

What the heck is going on here? I’m starting to feel pretty well hosed over this entire ‘upgrade’ deal. I’m about ready to put the old attenuator back in, but without calibration data for it, I’m still out of luc k.

Have lost my mind?

Mike - When you put a 'real' signal into it (like from a handheld or something), does it correctly read the power?

I have a feeling that it won't, meaning the wrong calibration data is in the box.

Until you get the right data in the box, you can use the 'fudge factor' entry. (I can't remember where it is, but allows you to use external attenuators & still have the box read correctly).

In the file section there is the cal file and the sw to read write to a pcmcia card

Also you need to change switch 1 to off on the main board (right side of the test set dip switches ) to load cal data .

I just installed 100 w upgrade and worked fine .
Read the note for the cal data file you need to change file name

When you go to the card there is only 1 file on it DNLOADCAL some thing like that

You can email me @ tleaher1@yahoo.com

Tim,

Comparing to my el-cheapo MFJ meter (which is all that I have handy right now), I see a difference of about 1 dB. I suspect the MFJ is the guilty party there.

Mike,
Just a heads up.
If you plan on returning the PCMCIA card to get a deposit back you might want to think twice.
I returned mine, just to recover some of my cost, a few weeks ago and have not heard anything from rfe_toys.
Not sure what's up. He will not respond to any emails also.
Just an FYI.

Other than that my CAL worked fine.
Just slightly off from my meter, an el-cheapo ham job :)
I suspect the meter.

Hmmm… when I uploaded the CAL data that came with the attenuator upgrade, there was no mention of changing the DIP Switch.

I checked the calibration of the power meter on the RF In/Out Port. It seems fairly close – about 1 dB different than the cruddy MFJ meter I compared it to.

I also went to the TESTS menu and ran the test for the Spectrum Analyzer; I fails in three places – exactly where you'd think it would fail based on what I'm seeing. I have to wonder if either the CAL data I uploaded was incorrect or corrupted or did not upload properly.

I see the files you mentioned; which attenuator is used for which version? I assume that 6 dB is for the 3-watt version, 14 dB is for the 60 watt version and 16 dB is for the 100 watt version – is that correct? I also see the program to write the files to the memory card, but I'm not sure the instructions makes sense to me. I'd have to look around to see if I even have a computer that has a PCMCIA port anymore.

Do ya'll think I need to re-upload the CAL data? Unfortunately, the card is already on the way back to the eBay vendor, and I don't know if I trust it at this point anyway. Does anyone have the 60 Watt CAL data on a PCMCIA card I can borrow? I'd also like to get a copy of the 3-watt CAL data in case I need to go back to the original attenuator. I'd be happy to pay for shipping and your trouble.

73,

Mike

Mike,
Just a heads up.
If you plan on returning the PCMCIA card to get a deposit back you might want to think twice.
I returned mine, just to recover some of my cost, a few weeks ago and have not heard anything from rfe_toys.
Not sure what's up. He will not respond to any emails also.
Just an FYI.

Other than that my CAL worked fine.
Just slightly off from my meter, an el-cheapo ham job :)
I suspect the meter.

When I did my upgrade, there was no mention of dip switch changing either. The unit measures input power correctly... Guess I ought to check the other input as well!

In the file section there is the cal file and the sw to read write to a pcmcia card

Also you need to change switch 1 to off on the main board (right side of the test set dip switches ) to load cal data .

I just installed 100 w upgrade and worked fine .
Read the note for the cal data file you need to change file name

When you go to the card there is only 1 file on it DNLOADCAL some thing like that

Hey Mike,

Setup RX test for 0dBm, set TX test for 0dBm,
hit Spectrum analyzer, and the tip is at 0dBm
(with jumper in place from Duplex out to RF in).

Sorry,

Tim

I returned a card about a month ago after an upgrade and while I did not hear from RFtoys, I did see a credit back on my master card.  Did you look at your statement ?

I may not have even looked at the paper statement as I can see it online almost as soon as a transaction is made on my master card.

Mike,
Just a heads up.
If you plan on returning the PCMCIA card to get a deposit back you might want to think twice.
I returned mine, just to recover some of my cost, a few weeks ago and have not heard anything from rfe_toys.
Not sure what's up. He will not respond to any emails also.
Just an FYI.

Other than that my CAL worked fine.
Just slightly off from my meter, an el-cheapo ham job :)
I suspect the meter.

Instead of turing and pressing the control knob, you can enter text using the PC keyboard. Let's say you want to save a setup to a new filename. On the 8924 press SHIFT and then the RECALL button. Enter the file name by typing on your PC keyboard. Make sure that the Caps Lock is turned on.

I uploaded another update

Hey Mike,

Setup RX test for 0dBm, set TX test for 0dBm,
hit Spectrum analyzer, and the tip is at 0dBm
(with jumper in place from Duplex out to RF in).

Sorry,

Tim

Got all the connections made per the manual,

Went into <shift> I/O Config, and set up per
the recommendations in the manual.

No responses from the 8924.

Do I need to initiate anything on the 8924
before it will respond?

Thanks,

Tim

Hmm, that was it! Could have sworn that I changed it.

Anyhow, thanks!!! Now just gotta put in the right terminal
emulation mode so the screen upload will look right.

Thanks again!!

On main io board there are 4 dip switches they lock the rom memory of the unit , the switch closes to the front of test set turn off ( change position ) re boot unit & continue with upgrade , the cal program will tell you to do this . If you didn't I don't think that cal was updated at all – you may get the right pwr reading??? . I did 100 watt upgrade .

Well I'm to just learning on this unit to

PS

Hi Mike,

After looking at things a bit closer (more than a ... yep, the peak looks like it's at the top...), it appears that I'm about 2dB off. With 0 out & referenced to 0, it says -2.35dB.

Well, mebbe I screwed up by not flipping the dip switches. Don't remember that screen coming up, but definitely didn't do it.

The input power looks correct.

Guess I'll try & get ahold of rf_toys & see what he says.

I know another guy who got it, and will ask him.

From: Mike (WM4B)
Topic: 532  Message: 575

Okay… I did some more tests tonight. Here’s what I found:

- All tests done at 100 MHz, 0 dBm

-- With 60 Watt pad installed (upgrade kit) and (supposedly) updated CAL Data
--- RF In/Out to Antenna Port: -22.39 dB
--- Duplex to Antenna Port: -12.6 dB

-- With 3 Watt pad installed (swapped back to original pad) and (supposedly) updated CAL Data
--- RF In/Out to Antenna Port: -1.6 dB
--- Duplex to Antenna Port: -11 dB

Based on this, (especially RF In/Out to Antenna Port: -1.6 dB with the original 3 watt pad installed) it sure seems to me like the CAL data did not update. Do you guys agree?

I know darn well it was right before the upgrade, and I also know that that pad only impacts the RF In/Out Port, so I can't explain why the Duplex to Antenna numbers are skewed... but I have to suspect that the CAL data also updates other parameters.

Ya'll tell me if I'm barking up the wrong tree... it's been a long day!

73,

Mike

From: Mike (WM4B)
Topic: 532  Message: 577

BTW, the cal program for the 60 watt upgrade did not specify this.

Where’d you get your 100 watt upgrade?

Mike

Subject: RE: [hp8924] Re: HP-8924C 60 Watt Upgrade from eBay

On main io board there are 4 dip switches they lock the rom memory of the unit , the switch closes to the front of test set turn off ( change position ) re boot unit & continue with upgrade , the cal program will tell you to do this . If you didn’t I don’t think that cal was updated at all – you may get the right pwr reading??? . I did 100 watt upgrade .

Well I’m to just learning on this unit to

PS

The control commands are very cool thanks Will

I got it from EBay about 10 months ago but never installed it, did not have time new job & chief at FD & 2 kids 9/3 keep me very busy, any way all I did was installed new pad & put in card started program it loaded to a screen told me to shut down change dip switch, reboot for cal upgrade, This make perfect sense to me because cal data has to be place on ROM chip so it cannot be change by user error??? ,

Also I went to test – rom – utilities you can run a complete diagnostic RF test on test set. just did mine & it is spot on – also checked power meter using a portable & 2 other meters 1- bird & 1- Motorola all were very close to the same reading

I'm pretty shore that I got mine from RF guys I will look it up

PS I would keep the sram card for storage3 of tests.

# 581. Video Converter 19.2kHz

Yahoo group: hp8924
Date: 2012-01-16 07:33:10 UTC
From: yobbo70
Topic: 581  Message: 581

Hello I have read with interest about the progress members have made with converting the video from 19.2kHz, well do and thank you,

I have found over the last year or so (since turning 40) I have come to rely on glasses and that CRT screen on the 8924c just keeps getting smaller,

For the last six months and for the next six months I and very time poor, due to family and work and more work commitments,

I have found a video converter that will sync from 12Khz to 40kHz it is a GONBES GBS8219 : ebay item number 260805206879

will this work on the 8924c I know it`s not cheap, but it would be worth it to see the display without my goggles on,

Thank you Ian VK4NFL

Thomas et al,

It does make sense - but there was no mention of it in the Cal procedure provided. More and more I'm convinced that my Cal data did not upload properly.

I've already sent the card back, and given that I've had at least one (and possibly 2) problems with Cal cards from the eBay seller, I'd sure like to get Cal data from someone else.

73,

Mike

From: Tim
Topic: 581  Message: 583

Hi Ian,

That may work. Have you looked into specific video monitors that will handle the 19.2 kHz sync?

It may be cheaper to get a monitor than the converter. (I have not looked for one)

There are no monitors that can sync up to 19.2 KHz. There were commecrial monitors like the ones used in airports that would work but they were very expensive and, more than likely, they are no longer manufactured.

You need something that converts the scan rate to a VGA monitor and that's what the GBS 8200 provides. For it to display properly on a VGA monitor, it needs a few modifications. There are photos that I uploaded in the Photos Section that shows how to modify the 8200 to work properly with the 8924.

Hi Wilco,

Thanks for the info.

I seem to remember us using some 19.2k monitors at work for our pcb layout workstations, but that has been a looooooong time ago!

Too bad there's not a cheaper solution.

They also needed two folks to lift!

Tim

I was able to modify the Horiz Hold circuit of a 17" B&W monitor to lock to the 19.2.
It is just hard to find any. Also you would need to add a isolation Transformer to some of the old tranformer-less monitors .

# 587. Need help from some of you guru's

Yahoo group: hp8924
Date: 2012-01-17 00:18:18 UTC
From: abrigno1
Topic: 587  Message: 587

I thought I had this figured out but not so sure now.

I am trying to sweep some reject cavities and am having trouble getting a good reading. The notch for a single cavity appears to be around -45Db, so with 2 in series I get around -90 dB. Problem is that at the bottom of the notch I am getting a lot of noise and not a clean dip. I can set the RF generator up to +15 db and that helps a little but not sure how to read the actual dept at that point vs what is on the unit.

What I thought was that if my reference was say zero then I had to subtract the gain from the RF generator to get the acutal reading. If both the RF generator and the reference were the same then I should be able to read the notch depth directly.

A quick simple explanation would sure help.

Also how deep a notch are you able to actually measure with the 8924C.

# 588. Re: [hp8924] Need help from some of you guru's

If you only care about the notch and not the exact value, around 125 to 130 db.  You set the generator to max  (18) and on the Auxilary screen the sensitivity to high.

Calibrated, about 10 db less.

The noise makes it difficult to get a very good reading that low.
I am thinking the sensitivity is around -115 db, so that is where the noise limits the measurements.

It helps to set the screen to about 2 or 3 sweeps by going to the auxilary screen and setting the one on the botom left to 2.  This sort of averages out some of the noise, but you have to wait for the trace to sweep that many times, so go slow.

If you set the generator to higher than 0, you add that value to the display.  When setting the main screen to minus db, it seems to track. But you have to add that value to the number of devisions on the screen if you look at the trace on the scope.

I think in your case if the generator is set to 0 db and the main is set to -50, then 4 main devisions down on the screen should be -50 and -40 for -90db.  To that add any ateunation you have in line.

I hope you are using double shielded or beter cables at that level.

# 591. RE: [hp8924] Re: HP-8924C 60 Watt Upgrade from eBay

Yahoo group: hp8924
Date: 2012-01-17 03:11:41 UTC
From: Mike (WM4B)
Topic: 532  Message: 591

Well, rfe_toys has new cal data (3 watt and 60 watt) heading my way. We☐ll
see what happens.

I also spoke at-length with Rick from Amtronix tonight; he called me on his
nickel and we spoke and troubleshot for at least 30 minutes. Based on what
we saw, either something got corrupted when the Cal data was uploaded, or I
just happened to suffer a failure in the Input Assembly, Receiver, or
Spectrum Analyzer at the same time I did the upgrade. Unfortunately, I've
been chasing electrons long enough to know that stuff like that DOES happen
and that it'll drive you nuts when it does.

Bottom line: I don't fault rfe_toys for whatever is going on here. There
have been enough satisfied customers for me to believe that Dan is a solid
guy and that I'm just the victim of some dumb luck. It was just my turn in
the barrel.

Also, I HAVE to give a huge shout-out to Rick at Amtronix. He and I have
been emailing all day today, and the phone call I got from him (along with a
lot of his valuable time) are WAY above and beyond what I could have ever
asked for. If I have to send the instrument for repair, you can bet it'll
go to Rick.

Thanks for all who offered advised and sanity checks.

73,

Mike

To: hp8924@yahoogroups.com
Subject: RE: [hp8924] Re: HP-8924C 60 Watt Upgrade from eBay

Got the new calibration data from the seller yesterday and got it uploaded.
Seemed to go okay this time.
Tonight I was playing with the instrument and connected my signal generator
to the -8924 Spectrum Analyzer input. With the signal generator set at 0
dBm, the Spectrum Analyzer showed about -13 dBm. I followed this up with a
loopback test (-8924 duplex out to antenna in) and go pretty similar
results. The delta tracks at about 13 dB regardless of the setting of the
generator output or frequency. Several different cables were tried.
What the heck is going on here? I☐m starting to feel pretty well hosed over
this entire ☐upgrade☐ deal. I☐m about ready to put the old attenuator back
in, but without calibration data for it, I☐m still out of luck.
Have lost my mind?

You can always use an external 20 db amplifier to boost the level. Mini circuits sells several models and you can find cheaper ones on eBay. You will need at least 1 watt.

Hi Dave,

Thanks for the reply.

Can you tell me what revision it is? (I got a copy of it, and it hung up the 8924 when I tried to run it. The guy I got it from says when he checked, it doesn't run on his 8924 either. (he thought it should).

So, I'm just looking for the revision number to see if I can find that one!

Thanks

Thanks for reply. I will try some of the suggestions later today.

For the sweep setup I am using 3 dB pads on the in and out and 2 6 ft runs of RG-142 cable and that also could be a problem. I can switch to 1.4 Heliax jumpers which I also have and that would probably work better at 450 MHZ.

Hi Tony,

Thanks for the info.

I had gotten the software on a card, but when I tried to load the Return Loss piece of software, it actually hung up the system. It is possibly a software incompatibility with the box. I'm running A.06.25 system software. (I didn't write down what version of the RF Tools software it was.... I sent it back to the guy).

Anyhow was wondering if your RF Tools software is version 2.0, and what revision firmware does your box run?

Thanks!

If you use an external amplifier, be very careful not to tune out of the notch as the excess power might be unfriendly to the spectrum analyzer.

I don't think your 8924 is too old to use RFTOOLS. The manual says that if you have a 8920A or 8921A that they need version A.14.00 or higher to run version B.02.00. But if you have a 8920B, any version of firmware will work. So I believe all 8924s would work.

For anyone interested, everything runs OK on an E8285A with firmware A.02.04

Hi Tim,
I hate to say it but you may be out of luck.
I hope the copy you got was low in cost.
EACH copy of RF Tools is serialized to a specific unit.
Go to Rf Tools website an root around a bit to see what
I mean.and then before you leave take a few minutes to
check out the videos while you are there. AWESOME!
You may have to buy a new copy for YOUR instrument.
However at the HAM discount of $300 a lot cheaper than the
commercial version and with the exact same features!
They do give HAMS a big break.

Hi Terry,
There are two" RF Tools", The original Agilent software 11807E Opt 100 and a current commercial offering from http://www.measurement.net.au/c/25306/1/rf-tools-software.html I think you are refering to the latter. The HP software is not linked to a specific unit. The HP version works fine on my 8920C.

Robert G8RPI.

That's true. He didn't give the out of band level. If it's -20, he's probably safe using a 20db amplifier. If he uses the antenna input, the "max" level is 200 mV (23 dbm) but the RF in/out is good for 3 watts (if it's a 3 watt unit). 3 watts is 35 dbm. 10 watts 40 dbm and 100 watts is 50 dbm.

I would set the RF generator for Duplex out and the spectrum analyzer for RF In.

I think the commercial version gives you latitude as to different serial number instruments. The "ham" version is married to the serial number you ask them to "burn" it to. The downside is that if your instrument wears out, you will need new software.

I think you simply press shift and then INCR/METER and then select on/off in the menu. At least that's how it works on the 8924.

# 610. External Vs Internal PAD for high power operation.

Yahoo group: hp8924
Date: 2012-01-18 18:28:37 UTC
From: rfiemiguy
Topic: 610  Message: 610

I have some thoughts about the high power option. I have a low power model and it seems that for sweeping reject filters and the like, the low power unit has greater dynamic range than when the high power option is installed. Thus an external 100 Watt 10 dB attenuator might be better option. Any thoughts? Am I correct in my assumption?

Topic: 610  Message: 613

Hi,
I agree with you. Having an external attenuator gives you the option of removing it and lowers the internal temperature. A 30dB is ideal as 1W = 1mW indicated. You can of course use any value and even an odd one is OK because you can enter the value into the 8924C to get correct readings. The only advantage I can see for an internal is the protection against accidental overload.

It depends which port you use. If checking Duplexers the RF Gen should be connected to the Duplex port. The output should be +10 dbm or better. Depending on the power option you have, it will be attenuated at the RF port.

Sounds like the same file I found. It was hard to find on the group I mentioned . LOTS of stuff there.

I spent some time today tracing the path from the front of the instrument back to the Spectrum Analyzer section and making sense of it all. It was actually pretty simple once I actually had some time and some quiet to digest it all. I□m borrowing another service monitor from a friend over the weekend so I can troubleshoot mine. Still keeping my fingers crossed for a good fix that doesn□t cost me my first-born-male-cat!

I use a 20db, 100 watt attenuator because it can handle 200 watts short term, which is 2 watts at the attenuator's output port. My 8924 is a 3 watt unit and that gives me enough headroom at 2 watts without worrying about over power protection.

I can still get -25 dbm through the attenuator which is more than enough power to measure receiver sensitivity. If I need more rf level, I just redirect the RF generator to the duplex port. The RF offset in the configuration screen doesn't apply to the duplex port.

Hi Will,
There are two "RF Tools" for the 8920B/8924. The original HP 11807E Opt 100 (Opt. 100 is important other options are cell phone testing etc). and  the more recent Measurement Innovations (MI) "RF Tools"  Both provide facilities such as swept gain, return loss, and cable fault location measurements (with an external return loss bridge), Intermodulation measurement and Receiver (scanner) functions The GPIB connectivity is screen capture and part of the MI version only. There are other programs available to do this for free. The HP software runs on the inturnal IBasic controller (the card contains a text file of the program). I don't know if the MI runs internally or externally. The HP one can be found for free as a binary image (you need an SRAM card to load it) and MI offer an amateur version of theirs for $290AUS, but you need the Agilent GPIB USB adaptor at $550AUS (there are Chinese clones on ebay but they may not work).
In short they add Scalar Network analysis and Scanner functionality.
See < http://cp.literature.agilent.com/litweb/pdf/11807-90141.pdf >, < http://cp.literature.agilent.com/litweb/pdf/5968-1379E.pdf > and < http://www.measurement.net.au/c/25306/1/rf-tools-software.html >

HTH,
Robert G8RPI.

What is this RF tools and what does it do when connected to the 8924? I assume it uses HPBasic commands via the HPIB port and you need an HPIB to serial or USB adapter.

> I bought a cheaper version but it didnâ€™t work with the Aussie software. Now I have bought the real HP one at great expense but I havenâ€™t tried it yet. I tried to install it on a computer with VISTA on it and it said I need SP1 or later so I installed SP1 and SP2 and then when I tried to install the RFtools it said it wasnâ€™t compatible with that version of windows. So now for another computer.

Where can I find the free version? I have a hunch that there's an Ibasic program that allows PC software to communicate to the 8924 via the serial port. I already mapped the serial port control codes and uploaded a document in the files section but I'm having problems retrieving data from the 8924 via the serial port. There is a screen capture control code that sends a bitmapped file to the PC but I need a way to get data from selected fields in each screen. I think an Ibasic program will do that. The purpose of this is to write a visual basic program that will control the 8924 via the serial port with out having to purchase the GPIB adapter.

Hi,
I'm not avertising it on group posts, but there is a copy in the files section ;-).Its called 11807Eopt100.bin I don't think Agilet has a problem with non-profit distribution of unsupported software, but would hate to loose it if Yahoo pulled it because they were not sure. You will also need a SRAM PCMCIA card (NOT flash or a CF adaptor) an older laptop with a PCMCIA card slot and a trial copy of Memeory Card Explorer software (also in files). If you open the BIN file with a text editor you can see the IBASIC listing. You could type it in from a PC acting as a terminal but it would take a while! If you have a PC with an GPIB/HPIB interface there is freeware that allows it to emulate an external disk drive for the 8924C. You could then use the built in utilities to load the program. I've not tried this and you would have to edit the BIN file to suit.
An SRAM card is easier. If you have trouble with this I could put it on a card for you.

Regards,
Robert G8RPI.

Hi,
It runs from te card. You go to config/tools select the card and then pick the program from the menu on the right and then select run. There are instructions in the link i sent earlier.

Robert.

Topic: 581  Message: 630

Following the instructions in the Opt 100 users guide, I copied the file to a 1MB card but when I select CARD in the TESTS screen, and move to the "Select Proceedure Filename", There are no proceedures that are listed.

I don't see a field named "TOOLS" in the TESTS or the CONFIG screen.

Topic: 581  Message: 633

While executing the Ibasic utilities, with my laptop connected to the serial port running the BTS terminal program, I noticed that text is sent to the laptop.

I was able to copy RF Tools to RAM but there's not enough RAM memory for all of the utilities included in the file. My favorite is the save/recall utility. You can save all of your setups at once without jumping between RAM and CARD. I'm still searching for a way to get data and cursor position via the serial port.

Could you give  more detail as to how you are able to run the RF tools from the laptop ?
I am assuming it is the HP RF Tools that is in the files section and not the comercial version from the third party.

I have the serial port from the 6 pin  jack tha looks similar to an 8 pin eithernet cable going to the laptop and it works as I can print the screen to the BTS utilities to the laptop.

The RF tools file I have is the bit image file.  Does that need to be changed somehow on the laptop to work through the serial port ?  If so , how ?

Rf tools runs on the 8924. To load the software into the 8924, you need a PCMCIA card, a laptop with a PCMCIA slot or an adapter to read and write to the card. The Memory Card Explore Utility in the files section is PC software that reads and writes to the PCMCIA card.

There's a document that I uploaded that list control codes that you can send from your laptop using the BTS utility, terminal screen.

I recently adjusted the IF filters in radio using the same method. Except this time, because the Radio down converts, I had to reverse the RF Gen tracking. To reverse the sweep, in the spectrum analyzer screen, go to the generator menu and change the Sweep from normal to reverse. The generator was sweeping above 30 MHz in the opposite direction (from high to low) but the spectrum analyzer was sweeping from low to high at 10.7 MHz. Keep in mind that when you down convert, the frequency spectrum is flipped.

# 638. Spectrum Analyzer ~ 12 dB off: WAS HP-8924C 60 Watt Upgrade from eBay

Yahoo group: hp8924
Date: 2012-01-29 00:36:15 UTC
From: Mike (WM4B)
Topic: 638  Message: 638

Dan from rfe_toys sent me yet another set of CAL data which I finally go to upload yesterday. As predicted, it made no difference; the Spectrum Analyzer is still about 12 dB off, regardless of whether of port.

I ran the diagnostics and it fails the following:

Spectrum Analyzer Vertical Sensitivity Test:

10 dB/Div Absolute 1.538**
2 dB/Div Relative .365**
1 dB/Div Relative .043**

Receiver Assembly Test:

Downconverter w/ Spectrum Analyzer
100 MHz 614.3 MHz IF -12.247
500 MHz 114.3 MHz IF -12.215
900 MHz 114.3 MHz IF -11.982

I also noticed then when I do a duplex test in loopback (feed the signal generator back to the test set), with 1000 Hz tone & 3 KHz FM deviation, the decoded tone is choppy and broken.

I replaced U502, the First RF Amp in the receiver module (which happens to be a 12dB amp) and there was no change.

My gut tells me it's in the Receiver module (and the downconverter tests SEEM to suggest that as well) but I'm kinda stuck at this point. I have access to an -8920, but only on the weekends, so troubleshooting time is minimal.

Any suggestions? Anybody wanna plug my Receiver Module and Spectrum Analyzer Module into a known-good test set and check them for me?

73,

Mike

Subject: RE: [hp8924] Re: HP-8924C 60 Watt Upgrade from eBay

Got the new calibration data from the seller yesterday and got it uploaded. Seemed to go okay this time.

Tonight I was playing with the instrument and connected my signal generator to the -8924 Spectrum Analyzer input. With the signal generator set at 0 dBm, the Spectrum Analyzer showed about -13 dBm. I followed this up with a loopback test (-8924 duplex out to antenna in) and go pretty similar results. The delta tracks at about 13 dB regardless of the setting of the generator output or frequency. Several different cables were tried.

73,
Mike

I remember back when the firmware in my 8924C was running Bata software. There was an Ibasic utility that browsed registers and you can modify the contents. I now upgraded the firmware to 6.33 but I don't remember the name if the utility or if it even exist in the the new firmware. I'm not near my 8924 and I won't have time to check the tests screen today. I remember there were registers that contained the calibration data that you can modify manually. The register names are abbriviated and it would take some time to find the correct ones. Before you modify the register it's always a good idea to write down the original value

Topic: 641  Message: 641

I spent several hours deleating blank pages, indexing and correcting bookmarks for the Component Level Information Packet. I was able to reduce the file size to 20 Mbytes. Unfortunately Yahoo Groups only allows 5.2 Mbyte uploads so I had the break up the file to smaller ones that are less than 5.2 Mbytes.

The original CLIP file had broken bookmarks, was very difficult to navigate and the titles we're nondiscriptive. I uploaded the files in the Files section where you will find a folder containing 5 files.

Hi,
Most of these have access to the battery from the end of the card. Easy answer is to change the battery with the card plugged in and the 8924C on. (Leave the write protect switch set to protect). You have of course backed up your card to a bin file using Memory Card Explorer (trial version)? It's best to leave the card plugged into the 8924C. While external power is supplied the internal battery is not being drained. Some units (don't know about 8924C) keep power on the SRAM card even when the unit is in standby.

That's pretty cool, I thought that the box had to write to the card, hence the SRAM 'reqmt'.

Makes it nice to not worry about losing the memory.

Think I'll try out a CF card & adapter & see if the explorer can write to the card.

Thanks for the info!

Hi Tim,
A CF card in an adaptor will not work in the 8924C. This is true even if you use a PC amd MCE to write to the card. CF adaptors use the CF card's IDE mode. The HP needs a random access mode. This is unformatted memory. The non volatile HP card are either ROM, EPROM or what is known as "linear" FLASH. Linear FLASH cards are are available but are expensive. CF cards (early ones at least) should have a "linear" mode, but the adaptors don't use it. I've been meaning to get a cheap (but with repeat availablity) CF adaptor and see if I can hack it into linear mode. I'm pretty busy at the moment though.

On the battery access, it can be pretty near invisible on some cards. Check the part number of the card. If its an HP application card it will be non volatile. Some (modern) SRAM cards have fixed re-chargable cells (some have both replaceable and rechargable cells).

Robert G8RPI.

You will need a sram card if you want to save any setups . you can copy the application to the sram and then change the default parameters and save it to the card. You always have the original copy on the hp flash card incase you lose sram battery.

Hi Tim,
I should have said that I did actually try a couple of CF adaptors. I also did some reasearch on the card specifications. The 8924C will never write to a flash card but it should read one with linear addressing. The IDE/ATA mode will never work.

Robert G8RPI.

# 653. How to Measure Age of a 8924C

Yahoo group: hp8924
Date: 2012-02-03 03:04:32 UTC
From: jsternmd
Topic: 653  Message: 653

I know that for the 8920A,B there is a ROM setting feature that will tell you how many times each attenuator section has been switched. Does the ROM on the 8924C have this feature aned what would be considered a really heavily used monitor? I recall seeing switch counts on 8920B of 150,000 per section and that was considered OK and not that "old" a unit. Anyone have any idea abouty switch counts and how that relates to past monitor usage? Does it matter?

thanks
Jerry

# 654. Starting points for duplexer tuning

Yahoo group: hp8924
Date: 2012-02-03 19:37:16 UTC
From: Paul Holm
Topic: 654  Message: 654

I'm new to tuning duplexers with my 8924c and was wondering if someone could help steer me.

I'm working on a four can VHF duplexer. Where are some good starting points for setting reference level, generator level, and frequency span when doing this?

If it matters, this one is a Sinclair Q202G with the two cans on each side 'hard wired', i.e., you can't tune each can individually. Each side has to be tuned together at one time.

I can see to tune the pass and notch but I'd also like to be able to see the combined response of one side in order to do a screen capture for documentation. Maybe with this duplexer, the combined response of one side would exceed the dynamic range that can be displayed at one time? Thanks.

73 Paul

you may have seen the tuning instructions for the duplexer already at
http://www.repeater-builder.com/sinclair/q202-208-218-tuning.pdf

Normally when tuning duplexers it was more of optimizing performance on the required frequencies and not so much on the overall display or sweep.

I would actually just tune at the discrete frequencies first making sure to terminate any open ports.

Really was never too interested in the pretty picture at the end if the performance on the required frequencies was correct. If you are sharing the site with other VHF gear you may want to take those frequencies into account when tuning.

Often the notches would be set to different frequencies to work with other repeaters on the same site . Often we had to reconfigure the duplexer ( differnt modele though )to get the passes and notches to match what was needed at the site ( public safety systems used a wide range of offsets and channels )

If you want to dump the final performance for VHF amateur you should only need a few MHz sweep width with the center between the TX & RX.
You may need a pretty decent output level with the dual notch ...0db to start with and adjust the output and width as needed to get the display you want. Not sure how well the 70db notches will show ...may need to vary the sweep width to optimize that view ...the analyzer does have an 80db range but to get that you may need a pretty narrow sweep.

I would look at three tests /sweeps ...RX to Ant, TX to ANT and RX to TX.

Would document the pass and reject losses at your discreet RX and TX frequencies as well with those three combinations to go with the screen shots.

To comment on what Paul told you. If you have sufficient antenna isolation, normally you would not concern yourself with tuning notches to other seperate repeater frequencies. By doing this you will lose isolation for the transmitter noise receiver desense TNDR of the new repeater itself. If I was in a situation where another TX was desensing the receiver, I would add reject cavities as required to the other transmitter if TX noise were an issue and to the new repeaters receiver if TX overload were an issue.

Generally I start out with the cables I intend to use (double shielded, type N connectors), a type N barrel to short the two together and the generator set to provide maximum level and adjust the generator such that the spectrum analyzer trace is normalized at 0 dB line at top of screen. Note that top of screen may auto range -10 0r -20 dB or so to account for the generator level +10 dBm or +20 dBm or so. To see the notch, you will need maximum generator level.

Normally I install a 3 or 6 dB attenuator pad on each end of my tuneup cables to ensure a true 50 ohm load. If you do this, you will normalize to the top 0 dB line with this additional attenuation.

Be sure to terminate any unused TX or RX port with a good 50 ohm termination before beginning. If the duplexer has connecting cables between the legs and the "T", note where they come off, because the length of each is critical to the tuning.

Adjust the span of the analyzer to best visualize the portion you are tuning so that you need only to make small deliberate adjustments.

If I can isolate each can in a series, I do so, first maximizing the passband and centering as closely as possible. I then switch to the reject band and center the notch as closely as possible. Note that you can fine tune the Reject by slightly skewing the passband, but only do this as final tweak so that the passband is not degraded.

I repeat this for the second can in the series of each leg.

With both cans of a TX or RX leg together, seeing deep into the reject band is the difficult part. The best method is to skew the passband as before to ensure the reject bands are lined up together and form a nice deep notch. That notch should meet or exceed the specifications. Check by counting dB down from top 0 dB reference on the screen.

If you did well in previous adjustments, you should not have disturbed the passband insertion loss and the duplexer should be tuned properly on that leg. Note that insertion loss is difficult to measure accurately unless you change the spectrum analyzer vertical scale to 1 dB/division.

Repeat all of the above for the other leg of the duplexer remembering that the frequencies for pass and reject are reversed.

If you have a reject only duplexer, there is only a reject frequency to be tuned,

When you are finished, measure both legs for IL and rejection and see if it meets spec. Do not get hung up with exceeding specs unless you have any doubt of the accuracy of your method. You can wear stuff out on some cheaper duplexers.

Thanks for the information Joe. I have been using pads on each port for testing and have made myself familiar with normalizing my instrument beforehand.

As for making measurements,do I need to re-normalize if:

- I change the generator level during tests?

- or if I change the reference level?

- or if I change the frequency span?

Yes to all.

When you normalize, you store a specific set of parameters in the 8924.  That is then used to refferance to when you use the b-a or is it the b-a function.
Any change that affects the B curve will mess up the calculations.

If just tuning for maximum notch or peak, it will not mater, but the values will be off.
YOu can tune without normilizing,but to get the absolute values, you will need to.

Hello, I purchased a MVC007 Video converter from Moncotech. and it works well with the 8924c and my 19" LCD monitor, finally I can see whats going on without glasses

However the video signal from the 8924c is 50ohm and the MVC007 requires a 75ohm signal, although it is working fine, what are the consequences of this mismatch? is there a way to convert the 50 ohm signal to 75 Ohm?

http://www.moncotech.com/products/mvc007/spec.php

Thank you very much

Add a 25 ohm resistor in series but your levels will be wrong. It would be better to use a 50 ohm termination resistor in the converter to maintain levels. I am surprised that the 8924 is 50 ohm out. I will see if i can check.
If it works on and no ringing I wouldn’t worry about it.

Hi Ian,
What makes you think the 8924C video output is 50R? As far as I'm aware it is 75R which is standard for video (the connector may be a 50R type). At this line rate a 50R/75R mis-match would not matter unless you were using very long (>10') video cables.

Regards,
Robert G8RPI.

Measure the un-terminated video output on a scope and it might be easier to note the amplitude of the sync pulse or the video if it is easy to see. Then terminate the out put with a 75 ohm resistor and if it drops by half, then it is 75 ohm output, which I am sure it is. The 8920 is for sure.

Ok looks like I might have got the 50R video out wrong sorry for the / my confusion, I have placed some photos in the photo section of the MVC007 RGB,MDA,CGA,EGA to VGA Converter I purchased of ebay for $185 USD plus shipping to me in Australia, it took a matter of seconds to plug in and set up. The photos were taken with a iPhone so the quality is not to good, and the LCD screen is a 19" wall mounted (and very dirty, has been up there for years)

I am so happy with the video out quality of this converter, finally have a screen I can see, and to me it`s worth every cent

thanks again

I have a VHS tape titled: Features and Basic Operation of HP 8920A Communications Test Set. I can find someone who has VHS to DVD conversion capabilities, I will gladly loan to them to create a digital copy for distribution. Not sure how long it is. Contact me off the board if you are interested.

I might be able to help. I have access to a S-VHS VCR that I've been planning on using to convert many or of our old videos to digital. Not that the S-VHS part will make a big difference on non S tapes but it does seem to give you a sharper picture then some. I am interested as I'm a fairly new owner of a 8924 and wouldn't mind seeing it. And this may be a good reason to set it up to my DVD recorder and convert our other tapes... Let me know

Wow;
I got a pretty good response on this. Tomorrow I will choose one and send the tape off to be converted. Thanks all who responded. One concern is where to host this file for the group as it will be too big for the files section. At least one person did offer to host temporarily. I will review my options, and am open to suggestions for hosting.

Thank you for taking the time and effort to do this.

I for one more would be very interested. I have an 8924C and have learned several tricks and techniques from this group. Not being a die hard pro I continue to find new things I can use it for.

When you find a home I would be interested in viewing it. I would be willing to pay for a hard copy CD if you can figure out a way to do it.

The Maxtrac mics all used a built-in pre-amp, so they probably wouldn't be a good choice.

Thanks for the tip on the MLS radio! I've got a first generation UHF MLS that can only be programmed via EPROM that was about to hit the bottom of a dumpster. (Can't even give it away at swap meets.) Didn't think of using the mic on the 8924. Duh!

From: brad_k9mhz
Topic: 662  Message: 689

Got mine the other day. Fires right up with no mods required. The wall wart the guy (Chinese grad student in New York on eBay....moncotech or something) was absolute crap. No documentation, either. He was typically stubborn, and obviously didn't care about his buyer. The unit is expensive, the power supply is worthless, the unit itself is good, and he's definitely not good.

FWIW.

Thanks, but I don☐t see the point in spending money on a connector when an 8-pin DIN (from the junk box) has a nice tight fit.

Found a couple microphones in the junk box I☐ll break out some jumper wires and see if any of them work well enough to warrant heating up the soldering iron.

A friend gave me a Motorola microphone. I'm not sure where it's from but it's red and it was very dirty. I soaked the housing in soapy water, replaced the cord and wired the bayonet DIN plug from Mouser. I found a replacement, D-104 element on eBay for about 12 bucks. The element works great and the microphone looks cool connected to my 8924C. I mounded a microphone clip to the side wall. I'll take a picture and up load it to the photo section.

Got mine the other day. Fires right up with no mods required. The wall wart the guy (Chinese grad student in New York on eBay....moncotech or something) was absolute crap. No documentation, either. He was typically stubborn, and obviously didn't care about his buyer. The unit is expensive, the power supply is worthless, the unit itself is good, and he's definitely not good.

FWIW.

Motorola mics. won't work (or any mic. that needs external power) as the 8924 doesn't have power available at the Mic/Accy connector. As others have noted, the GE mic is a good choice as is Regency, etc. There's a guy on ebay selling replacement CB mics for about $12. Those should work fine. OR you can still order one from Agilent (last I checked). They had some at their facility in Germany for, as I recall, about $770 PLUS shipping! Any takers???

I upladed photos of my modified Motorola microphone. I replaced the cord, wired a DIN plug from Mouser(part number 523-T3524-501). It's only 8 bucks! The D104 element came from eBay (12 bucks). The current eBay item number is 220952105730.

Hi,
I used a GBS8200. The 8220 is similar but has outputs for two monitors. I used a standard 4:3 SVGA LCD screen and an LM1881 as a sync separator (overkill, a lm311 voltage comparator works OK).  Search old posts to the group for more info.

On the subject of 50 Ohm to 75 Ohm the 8924 outputs a digital video signal. There's no analog video levels to deal with. The small impedance change is irrelevant. There might be a small change in the brightness but you can always compensate using the brightness or the contrast settings. There will be very little change in the sync level so you won't have to worry about that.

# 699. RE: [hp8924] Re: Video out Signal 19.2kHz 50 Ohm to 75 Ohm

Yahoo group: hp8924
Date: 2012-02-19 23:21:25 UTC
From: Mike, KD7MG
Topic: 662  Message: 699

I tried it with the dual-output GBS8220 and a LM1881 sync separator, but did not fare as well. I actually had better luck without the sync separator and just putting the composite video from the 8924 directly into the “Y” component BNC port. The picture was solid and stable, however, the image was horizontally shifted off the screen a bit on the left side.

I had to table the project temporarily while my o’scope underwent some repairs, but I can look at it again when I get a break in my schedule. I don’t know if I’ll be able to center the image or not, as (for some reason) the menu controls to do that are only available for the CGE/EGA/VGA inputs and not for the component input.

I’m tempted to buy the single output GBS8200 and see if there is indeed a difference between the two units.

Not that I noticed, but I didn't run it for an extended period either. The component input that I used might be better terminated than the CGA/EGA/VGA inputs apparently are.

Whatever.

Mouser's got the connectors if anyone needs them....just sayin'

# 703. GPIB with Agilent IO Library Locks 8924C keypad.

Yahoo group: hp8924
Date: 2012-02-20 16:52:40 UTC
From: jsternmd
Topic: 703  Message: 703

I am just beginning to play with my Agilent 82357B USB adapter. I hope to write some graphic interfaces for the 8924C as RF Tools from that Australia company is so very expensive.

I installed latest Agilent IO LIbs v16 and the 8924C is recognized and basic IO commands are recevied and sent properly. I have the 8924C set in Listen/talk mode but the monitor keypad is locked out to everything. I only have Agilent Control IO Tool running which I thought was a required interrface for any communication between PC and device for simple logging.

Any advice appreciated.

# 704. RE: [hp8924] GPIB with Agilent IO Library Locks 8924C keypad.

Yahoo group: hp8924
Date: 2012-02-21 02:21:48 UTC
From: Mike, KD7MG
Topic: 703  Message: 704

Anytime you communicate to the 8924C over the GBIP bus, the instrument will switch to "Remote" mode, indicated by an "R" in the top right corner of the display. In Remote mode, most front panel buttons are locked out. One that is not, is the "Local" button. Tap that once and your front panel will function again. You can also put the instrument back in Local mode over GPIB with the "GTL" bus command, but it should be the last command sent.

# 705. GBS8200 for Sale

Yahoo group: hp8924
Date: 2012-02-23 00:26:09 UTC
From: abrigno1
Topic: 705  Message: 705

I bought a GBS-8200 off Ebay to make a converter for my 8924C. When I looked at the solder joints I felt I didn't have the right tools and my hands weren't steady enought at 65 and bought the MVC007 instead. The GBS-8200 is for sale and the "Price is Right". It is new in box and I only took it out and looked at it. Contact me off list if you are interested.

I am looking forward to the MVC007. I have several LCD monitors both 17 and 19 inch and it will be interesting. What I have seen so far looks great. Hats off to the experimenters!!!!!!

For info, the guy on Ebay with the MVC007 had a "Buy It Now" or "Make Offer". I offered $185 and he took it with free shipping.

# 707. RF input/output Problem!!

Yahoo group: hp8924
Date: 2012-02-23 20:47:19 UTC
From: trjohn2049
Topic: 707  Message: 707

Warmed up unit for 30 mins Rom V A.06.33 60Watt Rf input version

I have a problem with the Rf input/output
At power up it shows all self test passed.

After that a warbling sound is heard and then goes off some times,and displays the message
(Reduce RF power input)

When zeroing the RF power, A Message comes on the top of the screen
and it says (Voltage out of bound. Remove RF power before zeroing).
I did all the service tests and it fails in the (RFDIAGS3) RF input
test and stop at the *** RF Dectector (low power),no signal ***.

Some times the unit will work and pass all the RF test and will zero
the RF power.
My next step is to check power supply for problems
upload Cal data for 14db 60watt Atten from Sram card
Maybe inop A-5 or A27 Refer module?
Any ideas from the group? Anyone have the same problem.
Terry

All this chatter over 50 vs 75 ohm for such a short run. Seriously, you
won□t be able to detect any difference in the picture. In fact, if you
REALLY want to get picky, then you□ll have to replace the BNC connector on
the back of the 8924, because (surprise!) it□s a garden variety 50 ohm
bulkhead BNC, like all the rest back there.

Just hook up what you have, fire up your analyzer and enjoy your big
display!

Mike

# 711. Re: RF input/output Problem!!

Yahoo group: hp8924
Date: 2012-02-25 04:52:23 UTC
From: willcoele@ameritech.net
Topic: 707  Message: 711

The problem could be a bad op-amp on the A23-2 "Electronic Input Section". I had a similar problem with my 8924C and I had to remove the monitor assembly to get the A23 aluminum casting. There are about 50 screws to remove the cover. If my memory serves me I replaced U2 an OP-467GS. You can get it from Digikey but they are expensive. I used a TLO84.

I didn't have a schematic at the time but I was able to connect the monitor and the A23 to run the unit. I measured voltages on the op-amps and found one where the output was stuck to the rail but I don't remember if it was the positive or negative rail.

The A-23 module, Yes I will take the unit apart again and make some tests on the OP's you listed. And yes it will take some time to take
the A-23 module out again with all 50+ srcews.

I just can'nt see why sometimes the unit works fine with no problems
and acts up with the RFinput error messages .I guess this is just one of the intermit problems HP 8924C can have.
This time I going to go over everything from A-Z from checking all the
Caps,modules ETC!!! and clean out all the dust it collects.
I will post some files and info when I get to know the moniter better.
I wlll update you later on what the problem was.
I want to say thanks for helping me on my trouble shooting,and for all the info/files you posted.

# 713. MVC007

Yahoo group: hp8924
Date: 2012-02-26 00:19:55 UTC
From: abrigno1
Topic: 713  Message: 713

Just hooked up MVC007 to 8924. Works super great. View is spectacular and super sharp. I highly recommend it.

I have stack of LCD monitors and first one I grabbed was wide 21 inch. I think it was too big. I closed up screen shot to make it smaller and got artifact on bottom of screen like second retrace. When I opened up height and width to more fill screen, artifact went away. I will dig out older 15 inch which is plenty big enought for me. The way it is set on my cart I am directly in front of it about 12-15 inches away. With the 21 inch wide that close it was like Imax.

Just for the hell of it I tried it with a power point projector and results were equally spectacular.

My 8924 never measured TX power. There were error messages but it was 3 or 4 years ago and I don't remember what they were. I think there was a TX power zeroing problem but it wasn't intermittent. In your case it could be a bad solder connection somewhere on the A23 module.

I'm wondering if you can run the 8924 without the monitor unit with an external monitor and the GBS8200 connected to the video out. That way you can get easy access to the A23 module while the unit is powered.

Frank;
Here is an update for all who have been interested in getting a copy of the video. Rich, N9EMS has kindly donated his time to transfer the VHS video onto digital DVD format. Once he is finished, I will be putting the file up on a website also donated by another member of the group, It will be available for all HP8924/8920'ers to download without cost.

Rich says the video I sent was a bit fuzzy on a small computer screen but says it looks pretty good on large screen. It was probably a copy or copy of a copy. He is fine tuning the video for best resolution.

# 720. Video question

Yahoo group: hp8924
Date: 2012-02-29 06:57:14 UTC
From: Rix Seacord
Topic: 532  Message: 720

Hi all.
Is there anything that has to be setup in an 8924c to get video at the
rear bnc connector.
I'm only getting a chain of negative going pulses of about 5 us duration
and around 51us apart. A quick look in the operators manual found nothing.
I've been watching some of the threads on adding monitors but they don't
seem to cover my problem.
Thanks much

I uploaded a photo in the folder "GBS 8200 Modifications" showing the video signal from the rear connector. Because of the short duration, it's possible that your not seeing the short, positive going, video pulses on you oscilloscope. I'm using a brand new Agilent DSOX3024, 200 MHz, 4 channel, digital oscilloscope.

Topic: 532  Message: 723

What you are seeing are the line sync pulses. Make sure you have a lot of a menu or data on the screen especially lots of highlight areas and that might make it easier to see the video. Try reducing your scope timebase down to about 5 to 10 mS and trigger off the frame sync.

# 725. Atten files Cal Data

Yahoo group: hp8924
Date: 2012-03-04 22:13:31 UTC
From: trjohn2049
Topic: 725  Message: 725

***** HP 8924C 60 Watt Cal update problem **********

Iam changing the in-built attenuator to a different power rating in my HP8924 (60 Watt) 14 db.dat file

How do I put the files into my 4mb sram card using Memory card
explorer program found in the download section.
It says to copy all the files and only use only one the db.dat files
and and rename to CALFILE.dat

Ok I understand that, but how do I put more then one file on my
sram card with out over writing the first file I put on the card, whats
the trick?
Also do I just startup the HP with the card in it with the new files
and just follow the intructions on the screen?

Below is all the info I found with the Cal files in the Readme.txt

---
**Copy these files to a PCMCIA card and run calbration proceedure if changing the in-built attenuator to a different power rating.

Include only 1 *.dat file after renaming to CALFILE.dat, ie remove xx dB atten.

# 727. Re: [hp8924] Using the HP 83236B as Spectrum analyzer downconverter

Yahoo group: hp8924
Date: 2012-03-05 18:29:12 UTC
From: Robert Atkinson
Topic: 726  Message: 727

Hi Yannis,
While the 83236B block diagram does not show filters, it almost certainly does have them and they will limit operation to the PCS band. I've used a simple external mixer to extend the range of my 8924C.  I just used the signal generator output on the aux port as the local oscillator. I used a packaged Mini-circuits balanced mixer. An external LO and two mixers will give you a tracking generator too. I used this setup to sweep some GPS filters. Ideally the external LO should be locked to the reference of the 8924C

Hope this helps,
Robert G8RPI.

Hi Robert,

Thank you very much for the hint. I confirm it works. I have used the HP-8924c with a couple of minicircuits SRA-11 mixers with an external LO and a splitter.

I wonder if the 83236B could provide a neater solution. A photo of the inside shows a very simple RF section with no filters (http://www.rfdh.com/ez1202/ezboard.cgi?db=info_ad&action=read&dbf=21703&page=0&depth=1). Unfortunately I do not own one (yet...) to confirm.

Thanks again and I will keep you posted.

Hi Yannis,
The main RF assembly appears to be underneath the large PCB. You can see 4 or 5 SMAs connecting to it. there is also no mixer visible in the picture, just a couple of attenuators and a coaxial relay. I,ve never seen a 83236B as we don't have PCS in the UK, but have scrapped a couple of the 83220E up/down converters used with the 8922x. This have fairly complex complex RF circuits. They are mostly stripline PCB construction and include filters. They are not suitable for use as a general purpose down converter.

The 70912 module intended to be used with the 70700 digitiser in the 70000 mainframe might be a good choice if you can find a cheap one. it's a 10MHz to 1500MHz converter. A quick look indicates that you could buy a mixer, amplifier, oscillator and filters in surface mount (stripline) packaging from Mini-Circuits for around $50. This would make a basic 1-2GHz down converter. Adding external attenuators and phase locking the oscillator to the 8924C's reference would make a useful unit. I also have an odd Tektronix unit, a 1405 Opt01 Television sideband adaptor, that looks usable too. It has a tunable oscillator and a packaged mixer. I just don't have time to play at the moment.

Robert G8RPI.

# 730. HP8920A/B Training Tape on VHS UPDATE Number 2!

Yahoo group: hp8924
Date: 2012-03-07 22:35:13 UTC
From: rfiemiguy
Topic: 730  Message: 730

Here is another update for all who have been interested in getting a copy of the video.

Rich, N9EMS has kindly donated his time to transfer the VHS
video onto digital DVD format.

The video is now ready to be uploaded to a host site. I know I had an offer from someone on this site to do this but cannot find the post.

If we have a volunteer with a host site, please contact me off line with information on uploading to your host site and I will upload the image file.

Thanks

It is about an hour long and probably best viewed on the "big screen"! Plus most folks might want a permanent copy of their own.

I don't know about Utube either, but I do know you can download from there.  Not sure if it can be downloaded faster than the hour run time or not from there.

Anyway I would like to see it.  Thanks for the time and effort.

Hi again Robert,

Thank you for sharing your valuable experience. I think we will have the answer in a couple of weeks as I found a 83236B in about 70□. Worst case scenario, I will try to use the main components, keeping the mixers and attenuators and removing filters and control circuits.

I'll keep you posted.

YouÂ  can see 4 or 5 SMAs connecting to it. there is also no mixer visible in the picture, just a couple of attenuators and a coaxial relay. I,ve never seen a 83236B as we don't have PCS in the UK, but have scrapped a couple of the 83220E up/down converters used with the 8922x. This have fairly complex complex RF circuits. They are mostly stripline PCB construction and include filters. They are not suitable for use as a general purpose down converter.
>
> The 70912 module intended to be used with the 70700 digitiser in the 70000 mainframe might be a good choice if you can find a cheap one. it's a 10MHz to 1500MHz converter. A quick look indicates that you could buy a mixer, amplifier, oscillator and filters in surface mount (stripline) packaging from Mini-Circuits for around $50. This would make a basic 1-2GHz down converter. Adding external attenuators and phase locking the oscillator to the 8924C's reference would make a useful unit. I also have an odd Tektronix unit, a 1405 Opt01 Television sideband adaptor, that looks usable too. It has a tunable oscillator and a packaged mixer. I just don't have time to play at the moment.

From: sv1mne
Topic: 726  Message: 736

Hi Robert,

In the meantime, I found a simple solution for my main need to cover the WiFi frequencies. I modified a California Amplifier MMDS downconverter which converts the 2500-2786 Mhz satellite TV band to 222-408 Mhz using a 2278 LO. By modifying the input filter I got a quite decent coverage of the 2,5 GHz spectrum +/- 300 Mhz.

Currently the Downconverters sell for about $14 (for a pack of two!) on eBay.

Hi Yannis,
You can't go wrong with a 83236B for $70. The step attenuator alone is worth at least twice that.  It will be interesting to see what is under the main PCB. If you are lucky it will be more indivdually packaged RF modules. It's at least a quality case, connectors  etc. The MMDS down converters look ideal for 2.4 GHz. Lots of info on retuning them on the web. They have the advantage that they are cheap and plentiful so it is worth spending time on and possibly damaging some to get a solution. The 83220Eis just too big to work on, too complex and too application specific.

Have fun,
Robert G8RPI.

# 738. Re: Using the HP 83236B as Spectrum analyzer downconverter

Yahoo group: hp8924
Date: 2012-03-10 08:14:54 UTC
From: sv1mne
Topic: 726  Message: 738

Hi again Robert,

The HP 83236B arrived yesterday. It works fine as a 1700-2000 MHz transverter, with full control from the HP-8924c and HP-8924e.
As you said, the main RF assembly is underneath the large PCB. It seems quite complex, exactly what you would expect for a laboratory microwave instrument with full control and self-check. The range 1700-2000 MHz is restricted in firmware so it cannot easily go outside those limits. Of course striping out all control circuitry and filters could leave a quite decent down/up converter, but I think its a pity... I'll keep it as is since the MMDS downconverters helped me cover my main need. Now I am working on an upconverter for extending the tracking generator.

Thanks again for your help.

Yiannis;
The prices of these have become so low, I am ready to bite. Can you tell me what control software I will need to run it and where to find it? I have an 8920B if that makes any difference.

Joe

Hi Joe,

First, download the HP-83236b Operating manual, which has details for installation an operation with the various HP-89xx test sets.
Fortunately the HP-8920b with firmware B05.00 and above, can control it directly through the serial port as with the HP-8924c and HP-8924e, so you do not need to work remotely through the GPIB.

I am not sure if you also need the 83206 cellular adapter which is mentioned in the relevant section of the manual.

Best R.

Hi Yannis,
Glad it all works OK. I'd buy one myself but the cost shipping to the UK just kills the deal.

Regards,
Robert G8RPI.

Hi again Robert,

The HP 83236B arrived yesterday. It works fine as a 1700-2000 MHz transverter, with full control from the HP-8924c and HP-8924e.
As you said, the main RF assembly is underneath the large PCB. It seems quite complex, exactly what you would expect for a laboratory microwave instrument with full control and self-check. The range 1700-2000 MHz is restricted in firmware so it cannot easily go outside those limits. Of course striping out all control circuitry and filters could leave a quite decent down/up converter, but I think its a pity... I'll keep it as is since the MMDS downconverters helped me cover my main need. Now I am working on an upconverter for extending the tracking generator.

Thanks again for your help.

> Hi Yannis,
> You can't go wrong with a 83236B for $70. The step attenuator alone is worth at least twice that.Â  It will be interesting to see what is under the main PCB. If you are lucky it will be more indivdually packaged RF modules. It's at least a quality case, connectorsÂ etc. The MMDS down converters look ideal for 2.4 GHz. Lots of info on retuning them on the web. They have the advantage that they are cheap and plentiful so it is worth spending time on and possibly damaging some to get a solution. The 83220Eis just too big to work on, too complex and too application specific.

I modified a California Amplifier MMDS downconverter which converts the 2500-2786 Mhz satellite TV band to 222-408 Mhz using a 2278 LO. By modifying the input filter I got a quite decent coverage of the 2,5 GHz spectrum +/- 300 Mhz.

YouÃ‚Â  can see 4 or 5 SMAs connecting to it. there is also no mixer visible in the picture, just a couple of attenuators and a coaxial relay. I,ve never seen a 83236B as we don't have PCS in the UK, but have scrapped a couple of the 83220E up/down converters used with the 8922x. This have fairly complex complex RF circuits. They are mostly stripline PCB construction and include filters. They are not suitable for use as a general purpose down converter.
> > >
> > > The 70912 module intended to be used with the 70700 digitiser in the 70000 mainframe might be a good choice if you can find a cheap one. it's a 10MHz to 1500MHz converter. A

quick look indicates that you could buy a mixer, amplifier, oscillator and filters in surface mount (stripline) packaging from Mini-Circuits for around $50. This would make a basic 1-2GHz down converter. Adding external attenuators and phase locking the oscillator to the 8924C's reference would make a useful unit. I also have an odd Tektronix unit, a 1405 Opt01 Television sideband adaptor, that looks usable too. It has a tunable oscillator and a packaged mixer. I just don't have time to play at the moment.

I've used a simple external mixer to extend the range of my 8924C.Ãƒâ€šÃ‚Â  I just used the signal generator output on the aux port as the local oscillator. I used a packaged Mini-circuits balanced mixer. An external LO and two mixers will give you a tracking generator too. I used this setup to sweep some GPS filters. Ideally the external LO should be locked to the reference of the 8924C

Yiannis,

Sorry to break in but I don't know how to reach the correct Yahoo group. I recently bought a like new HP8935/AgilentE6380A since the price was in my comfort range. It has many of the features I wanted such as HF band coverage, spectrum analyzer, tracking gen., etc. What am I missing compared to thehp8924?

The 8924 isn't portable at all... tags on the side say 'two person lift'! :-)

Also, the 8924 isn't really spec'd to do HF coverage.

You can look here and find many of the differances.

http://www.amtronix.com/e6380a.htm

While there, you may want to look around at other HP monitors they sell.

Sure it is portable it only weighs 60 pounds instead of 40 pounds like the 8920 and 50 pounds like the 6380...

Most of the 8924C's will go to about 10 mhz and still be close to spec.  All that changes is the power input and output power is somewhat lower below 10 mhz on most of them.  They will still cover the same frequency ranges.
They are about 3 db off at 3 mhz, but drop off fast after that.

Thanks;

My unit has 6.x firmware so should work.
When you operate the test set does it display the actual frequency? Are their bands or do you get contiguous 1710-1990 MHz?

The range 1700-2000 MHz is restricted in firmware so it cannot easily go outside those limits. Of course striping out all control circuitry and filters could leave a quite decent down/up converter, but I think its a pity... I'll keep it as is since the MMDS downconverters helped me cover my main need. Now I am working on an upconverter for extending the tracking generator.

# 747. 8294c Prospective Purchase Advice

Yahoo group: hp8924
Date: 2012-03-11 12:19:31 UTC
From: Dawn
Topic: 747  Message: 747

I'm looking to purchase a 8294c, but besides the high power and spec/tracking generator option, I'm hoping to find what an optimum combination and model revision would be. I don't think that I'm going to find a mechanical attenuator version among the lot that are listed on e-bay. The prices look good under $1K USD, but I'm also wondering if it's worth the extra $600-$700 USD to buy one tested and semi-refurbished from a reliable vendor such as Amtronics. I'm sure that many of you have taken both routes and have retrospective opinions based on experience. Ebay vendors seem to have some very clean looking units with 60/100W inputs and the spectrum analyzer options that claim to pass on board diagnostics and some include the RF tools card.

Any advice for someone looking to purchase one? Would most of these pulled from service have significant screen burn/monitor deterioration that would warrant a new crt or replacement monitor module?

Hi,
Have a read through the archives. The spectrum analyser and TG are standard on th8924C so that's not an issue. The electronic attenuator is more reliable and better unless you need accuracy below 10MHz. Ebay or Amtronix? Thats a personal choice based on your comfort level and ability to tackle a repair vice budget. Personally I'm undecided on the high power option. I certainly would not pay extra for it. Screen burn varies from unit to unit, you need to check with the vendor. If you get a bargain unit with screen burn there is the option of an external VGA monitor with a converter. I bought mine on ebay as part of a job lot of test gear and have had no problems at all.

Robert G8RPI.

I can highly recommend Rick at Amtronix. Looking at his website he offers the 8924C (100 watt) with a new CRT and calibrated. I purchased these options on mine and have had no issues. When I purchased mine the prices on Ebay were not as low as they seem to be now. I felt much better doing business with someone that was willing to spend time on the phone discussing my needs and the possible alternatives in equipment. It is possible Rick is selling his equipment on ebay also.... Not sure about that, but could be something to ask him. Great guy to do business with.

Hi EC Welch,

You bought the ultimate test set! It has all the features of HP-8924c, plus 1700-2000 MHz coverage and it is more compact and trasportable. The main differences is that the HP-8935 has a 30 KHz IF filter instead of 15 KHz and does not measure frequency automatically. More info in http://www.amtronix.com/e6380a.htm.

Best R.

Yiannis

Joe, in the HP-8924c you get continuous covetage from 1700 to 1999 MHz and it displays the actual frequency.

From: sv1mne
Topic: 726  Message: 752

Robert, I bought mine from Israel. Sometomes they have us equipment with much lower shipping costs. But have in mind that you cannot use the tracking gen with the 83236 and after many hours of experimenting, I feel more comfortable with the MMDS Downconverter and your suggestion for using two mixers and locking the pll to the 8924 ref seems even better.

Thanks

Yiannis

If you are lucky it will be more indivdually packaged RF modules. It's at least a quality case, connectorsÃÂ  etc. The MMDS down converters look ideal for 2.4 GHz. Lots of info on retuning them on the web. They have the advantage that they are cheap and plentiful so it is worth spending time on and possibly damaging some to get a solution. The 83220Eis just too big to work on, too complex and too application specific.

I modified a California Amplifier MMDS downconverter which converts the 2500-2786 Mhz satellite TV band to 222-408 Mhz using a 2278 LO. By modifying the input filter I got a quite decent coverage of the 2,5 GHz spectrum +/- 300 Mhz.

YouÃ□â□□Ã□Â  can see 4 or 5 SMAs connecting to it. there is also no mixer visible in the picture, just a couple of attenuators and a coaxial relay. I,ve never seen a 83236B as we don't have PCS in the UK, but have scrapped a couple of the 83220E up/down converters used with the 8922x. This have fairly complex complex RF circuits. They are mostly stripline PCB construction and include filters. They are not suitable for use as a general purpose down converter.
> > > >
> > > > The 70912 module intended to be used with the 70700 digitiser in the 70000 mainframe might be a good choice if you can find a cheap one. it's a 10MHz to 1500MHz converter. A quick look indicates that you could buy a mixer, amplifier, oscillator and filters in surface mount (stripline) packaging from Mini-Circuits for around $50. This would make a basic 1-2GHz down converter. Adding external attenuators and phase locking the oscillator to the 8924C's reference would make a useful unit. I also have an odd Tektronix unit, a 1405 Opt01 Television sideband adaptor, that looks usable too. It has a tunable oscillator and a packaged mixer. I just don't have time to play at the moment.

# 753. Re: [hp8924] 8294c Prospective Purchase Advice

Yahoo group: hp8924
Date: 2012-03-11 14:49:37 UTC
From: Michael A. Waldron
Topic: 747  Message: 753

I bought mine from an eBay seller, RFE_Toys in Washington state. Dan was very straightforward and honest about the condition of the analyzer I would receive. He told me he is a former HP employee that worked in their test equipment division in Washington before they relocated it.

My unit arrived very well packed and 100% functional. When it's turned off it's easy to see it spent it's life on the CDMA test screen but once you power it in the burn-in doesn't effect operation at all and the display is easy to read. I peeked inside the case to see if it was full of dust, and the unit appeared to be internally very clean.

Dan did tell me he calibrates his units, but he doesn't provide any sort of certification so if that's important you probably want to go right to Amtronix.

It's likely that if I find a good deal on a new CRT I will purchase it. I'm also likely to get a spare power supply since those seem to be the things that die and I'd like to have this for another 20 years or more. Something else to consider is that with the GBS-8200 is a lot cheaper and easier than a new CRT.

Anyway I was very happy with Dan's product and his prices were able to get me a piece of equipment I had wanted for years and just couldn't afford any other way. I have little doubt I'll be dealing with Amtronix in the future too, and their reputation is impeccable.

I have been learning how to use it 1 function at a time over the last few months and I finally have all the basic stuff down. My next trick is to learn how to tune a duplexer.

# 755. Re: [hp8924] Re: Using the HP 83236B as Spectrum analyzer downconverter

Yahoo group: hp8924
Date: 2012-03-11 16:16:39 UTC
From: Robert Atkinson
Topic: 726  Message: 755

Hi Yannis,
I had a look at the setup I last used (about 3 years ago). I used two mini-circuits ZFM-15 mixers because they were to hand, but the ZFM-4300 might be a better choice. Looking through my junk box I found a phase lock module and YIG from a old 8554A 141T RF plug-in. This will give a nice 2-3GHz LO locked to a 1MHz crystal in the phase lock module. A modification to replace the 1MHz crystal with a divide by ten fed from the 8924C reference would keep everything locked up. All I need is some time :o)

Robert G8RPI.

Robert, I bought mine from Israel. Sometomes they have us equipment with much lower shipping costs. But have in mind that you cannot use the tracking gen with the 83236 and after many hours of experimenting, I feel more comfortable with the MMDS Downconverter and your suggestion for using two mixers and locking the pll to the 8924 ref seems even better.

Thanks

Yiannis

> The HP 83236B arrived yesterday. It works fine as a 1700-2000 MHz transverter, with full control from the HP-8924c and HP-8924e.
> As you said, the main RF assembly is underneath the large PCB. It seems quite complex, exactly what you would expect for a laboratory microwave instrument with full control and self-check. The range 1700-2000 MHz is restricted in firmware so it cannot easily go outside those limits. Of course striping out all control circuitry and filters could leave a quite decent down/up converter, but I think its a pity... I'll keep it as is since the MMDS downconverters helped me cover my main need. Now I am working on an upconverter for extending the tracking generator.

> > Hi Yannis,
> > You can't go wrong with a 83236B for $70. The step attenuator alone is worth at least twice that.Ã‚Â  It will be interesting to see what is under the main PCB. If you are lucky it will be more indivdually packaged RF modules. It's at least a quality case, connectorsÃ‚Â  etc. The MMDS down converters look ideal for 2.4 GHz. Lots of info on retuning them on the web. They have the advantage that they are cheap and plentiful so it is worth spending time on and possibly damaging some to get a solution. The 83220Eis just too big to work on, too complex and too application specific.

I modified a California Amplifier MMDS downconverter which converts the 2500-2786 Mhz satellite TV band to 222-408 Mhz using a 2278 LO. By modifying the input filter I got a quite decent coverage of the 2,5 GHz spectrum +/- 300 Mhz.

YouÃƒâ€šÃ‚Â  can see 4 or 5 SMAs connecting to it. there is also no mixer visible in the picture, just a couple of attenuators and a coaxial relay. I,ve never seen a 83236B as we don't have PCS in the UK, but have scrapped a couple of the 83220E up/down converters used with the 8922x. This have fairly complex complex RF circuits. They are mostly stripline PCB construction and include filters. They are not suitable for use as a general purpose down converter.
> > > >
> > > > The 70912 module intended to be used with the 70700 digitiser in the 70000 mainframe might be a good choice if you can find a cheap one. it's a 10MHz to 1500MHz converter. A quick look indicates that you could buy a mixer, amplifier, oscillator and filters in surface mount (stripline) packaging from Mini-Circuits for around $50. This would make a basic 1-2GHz down converter. Adding external attenuators and phase locking the oscillator to the 8924C's reference would make a useful unit. I also have an odd Tektronix unit, a 1405 Opt01 Television sideband adaptor, that looks usable too. It has a tunable oscillator and a packaged mixer. I just don't have time to play at the moment.

OK boys and girls. The file is finally ready for downloading. Many thanks to Joe Leikhim, K4SAT for providing the VHS video and Rich Vanderwerker, N9EMS for doing the analog to digital conversion. As was mentioned, the quality is not quite up to today's standards, but is probably not far from what a copy of the original tape could muster.

This plays fine on Windows 7 or Vista using the latest Windows Media Player, however, you may find Windows XP machines might need an additional codec. I tested many of the popular add-on "Codec Packs" and they all worked fine. An alternative, is to use a different media player, such as the VLC Player, or (my favorite) the GOM Player.

Ubuntu 11 had no problem playing it with their native Movie Player. It also ran fine using Banshee, SMPlayer, and VLC. Sorry, no MAC VM, so you're on your own. J

For those with slower DL capabilities, Joe included a set of 5 split files that can be downloaded individually and reconstructed using 7-Zip. The reconstructed file size ends up being slightly larger than the direct download one, but appears to be identical while played. (Not sure what happened there.)

OK, here's the link.
http://grovesnet.org/Downloads

Cheers,
Mike, KD7MG

Mike and Joe, thanks for all the effort. I am very interested in it. If there was any expense involved I sure won't mind contributing to the effort. Let me know how.

I am having a problem with the download. I have tried 2x times and both times it cut off around 850 Meg. File size shows 1.12 gig. It is taking something like 25 minutes. Wonder if my server or yours is timing out? I am on Comcast with a high speed line and have loaded several large files over 1 Gig but they were at a lot higher download speed and didn't take as much time.

I am running XP Pro so I will have to find a different viewer or codec. I also have two machines running 7 Pro so I can see it on that.

Any ideas???

Thanks again for all the work. I am looking forward to the video. I have learned a lot from this group and added the video converter and a 15 inch CRT. It works great.

I have had my 8924C for about 3 years and not being an expert I am still finding things in menu's. I was poking around one day in the sub menu's and there was large kerchunk and a cold 12 can of Budweiser came out the back. Haven't been able to find that menu again. Maybe it will be in the video or I need some kind of converter.

Tony;
I was able to DL the large M4V file in about 30 minutes with a standard rate cable modem (Brighthouse). Try resetting your cable modem and trying at a an off hour time of day.

Alternately, you might have luck DL the 5 zip files and using winzip or 7-zip to reassemble.

Thanks to all that put out this file.

I am using Windows XP and downloaded the VLC player and GOM.  They both play the file. Several other programs I have would not play the file.

Now I just need time to look at the whole thing.

This plays fine on Windows 7 or Vista using the latest Windows Media Player, however, you may find Windows XP machines might need an additional codec. I tested many of the popular add-on "Codec Packs" and they all worked fine. An alternative, is to use a different media player, such as the VLC Player, or (my favorite) the GOM Player.

Ubuntu 11 had no problem playing it with their native Movie Player. It also ran fine using Banshee, SMPlayer, and VLC. Sorry, no MAC VM, so you're on your own. J

For those with slower DL capabilities, Joe included a set of 5 split files that can be downloaded individually and reconstructed using 7-Zip. The reconstructed file size ends up being slightly larger than the direct download one, but appears to be identical while played. (Not sure what happened there.)

OK, here's the link…
http://grovesnet.org/Downloads

Cheers,
Mike, KD7MG

I had trouble downloading the whole file and I sent a note to gang.

Both times I downloaded it - it stopped around 850 Meg bytes vs. a file size of 1.12 Gig. I am showing down load speeds of about 750 Kbps. and I am wondering if something is timing out.

I am running Win XP Pro with Comcast. I show download speeds around 25 Mbps so don't think bottleneck is on my end.

I have download the pieces but hope single download will work.

I have VLC player and can use it, so it is good info. Sounds like I may need to get GOM also.

OK boys and girls. The file is finally ready for downloading. Many thanks to Joe Leikhim, K4SAT for providing the VHS video and Rich Vanderwerker, N9EMS for doing the analog to digital conversion. As was mentioned, the quality is not quite up to today’s standards, but is probably not far from what a copy of the original tape could muster.

This plays fine on Windows 7 or Vista using the latest Windows Media Player, however, you may find Windows XP machines might need an additional codec. Tony I have a cable connecton and the computer said about 20 minuits to download.  I did not time it. Was running about 1 meg speed for the download on the computer screen.  I think the down load speed is normally 8 or 10 mbs for my system in tests. Seems like it downloaded the large file and then a smaller one for some reason.  The final results was just one file about 1.2 GB.

The VLC player should work for you.  It did for me,  I downloaded that and the GOM while I was hunting for something to play the file as none of the other programs I had would show it.  Atleast the programs are free.  Seems that everytime I turn around there is a new format in the vidio file to look for.  Will save me time when I run across other vidio formats.

Yeah, I'm having problems now too DL'ing the whole thing without having it quit ¾ of the way through. It's on a shared webhosting service that I've had with 1and1.com for many years. They might be artificially limiting large DL's, as it's not exactly in harmony with their terms of service. Grrr… The only thing I can suggest is to DL the 5 parts and put them together.

Another option is for someone to host a torrent. I've DL'ed a few, but never started one, so I'm not fully up on the procedure of getting all the trackers set up correctly.

I'll try and help geting a version that will play on the MAC once I get a playing copy - I've downloaded the complete file and couldn't open it with VLC or quicktime or any of my other media players. Downloading the zip pieces to try and piece things back together, I'm suspicious of the size of the whole file, looked like ~950 meg to me. I'm on a very high speed connection, I seriously doubt incomplete downloads are my problem.

It looks like 800 meg is the limit for some reason.

It downloaded the pieces fine and I can unzip and assemble.

Can somebody give a quick procedure for Win XP or Win 7??

VLC and Quicktime on the MAC love it when extracted from the zip file
version. Good to go here.

FYI on my mac, many of my archiver tools wouldn't open the multiple zips,
but this one worked

http://wakaba.c3.cx/s/apps/unarchiver.html

Roger,

If you downloaded the full version and it's not exactly 1,211,762,242 bytes, then the server aborted your DL prematurely. It's been my experience that if this file is incomplete, it won't work in any player.

hi gang
First thanks much to whoever finally got the file done and posted. This box is really amazing once you get into it and play.
I use plain old windows media to play it, version unknown, to play the video with window 7 64.
The download speeds got flaky. From about 500k/min to just over one meg. Took a couple of attempts.
Using FIOS I get speeds up to 3meg/sec from other sites down to a snails pace.
From what I've seen some sites are being throttled or just plain slow from activity.
Thanks again.

Try and change the file to a mp4 extension, I had to do this and it worked fine.

The orig file would not play and a google on the file extension gave some tips.

My download size was the same as the below when viewed via right click and properties on the file.

File manager shows the size as 1,183,362KB, whereas right click and properties shows it as 1,211,762,242 bytes

If changing the file extension to MP4 doesn't work, you might need to DL it again. It should play in most any version of VLC or GOM.

Slight change of plan. Being as my webhost is not cooperating with the single large file, I removed it. In place, I added another set of smaller pieces to DL. These are from WinRAR, for those familiar with that, and should reassemble using either WinRAR or 7-Zip. Just another option to the original set that Joe created. They can be found here.
http://grovesnet.org/Downloads/

For those interested in getting it in one chunk, Jim has kindly uploaded it to his site here (and it's working much better than mine did).

I had a friend download it on his T1
I have had no luck getting anything to play it
Have tried newest version of VLC and GOM on Win XP Pro
and have tried win media player on 7
same results on all
If I get it to play will try to convert it to a useful format and post it

I don't think that I'm going to find a mechanical attenuator version among the lot that are listed on e-bay. The prices look good under $1K USD, but I'm also wondering if it's worth the extra $600-$700 USD to buy one tested and semi-refurbished from a reliable vendor such as Amtronics. I'm sure that many of you have taken both routes and have retrospective opinions based on experience.

My experience with buying test equipment that hasn't been thoroughly tested (just the usual, "well, it powers up!" -- but they allow returns) is that about 10% of such equipment will tend to have some problem, such as being woefully out of cal, some particular output doesn't work, etc.

The 8924C is a very complex box and there's a lot that can go wrong.

If you have the extra time to potentially deal with returns for a not-fully-working item (and note that you'll be looking at ~$100 to ship back an 8924C within the U.S.) -- as well as some familiarity with this sort of equipment to thoroughly test it yourself in the first place (although the 8924C does have some very good built-in self-tests) --, I'd say get the cheaper units and take your chances.

But I don't consider the extra money for a well-tested unit at all poorly spent, either -- especially if you do want something that "just works" in short order or really don't enjoy troubleshooting your own test equipment.

The 8924C I have now came from Amtronix... after I first did get an eBay special that turned out to almost-but-not-quite work.

You might ask Rick at Amtronix if he has any special offers available at present; from time to time he does.

I can also vouch for Rick - I purchased my 8924c from 'Jim' on ebay - it was ok, but Rick went through it and fixed some minor stuff, did a cleaning and calibration, and gave top notch service for a fair price. Couldn't be happier.

From: rfiemiguy
Topic: 747  Message: 784

Back before I bought my personal 8920B, I was shopping for one for the company I worked for. I put out a bid for a specific set of options including the high power option, calibration and certification and a 1 year warranty from the seller. A used unit with these requirements was going for about $10K and that was what was expected. A used unit without the high power, without the certifications and without warranty could be had for much much cheaper. But for the company, having certifications and warranty was desired.

We settled on one of the nationally advertised test equipment resellers here in Florida assuming that with their huge advertising budget, they must be reliable - right? wrong! They could not get the calibration of the power input set correctly and despite the fancy certificate a 60 watt input looked like 120 watts and the unit would scream ALARM! Finally after several trips back and forth we ended up buying a new low end General Dynamics unit. (not as nice).

I ended up buying my personal 8920B from a closeout lot from Ericsson who was closing up cellphone operations in VA. The unit had been rack mounted in a lab environment had some minor CRT burn in, but otherwise very clean and new in every other way. The seller offered a 5 day right of return which gave me the opportunity to see how great it was and perform self checks and loop backs.

There are similar deals available for the 8924 series and the newer 8935. This is the time to shop around and find a nice unit.

# 785. Re: Using the HP 83236B as Spectrum analyzer downconverter

Yahoo group: hp8924
Date: 2012-03-15 06:23:29 UTC
From: Dawn
Topic: 726  Message: 785

Some of the low end spectrum analyzers made by ATTEN and other Chinese OEM's offer a two single band range downconverters listed as "Frequency Extenders" One covers 1-2 gig ATT5000F1 ($200+), the other 2-3 ghz, ATT5000F2 ($300+). I've also seen another labled as u-TEK offered as an accessory with other inexpensive instruments from time to time on E-bay. These don't appear to extend the tracking generator option on these units, just the frequency display.

I bought a 100 watt upgrade kit from RFE-Toys in WA.
Sent the card and old heatsink back for a refund and waited for a month.
Tried contacting Dan for a status of my refund. After several weeks he finally left me a voice mail stating that he never received the card or attenuator and that I should file a claim with USPS.
If you do any dealings with him I highly suggest delivery confirmations, signatures etc...etc...
Learned my lesson.

Also FWIW I believe Amtronix installs a new CRT in every 8924C sold. New CRT's can be found on Ebay for around $200.

Don

Can someone please tell me why these miniscule (in capacity) memory cards cost so darn much? They want more for one of these than I paid for a memory upgrade for my laptop and that was several orders of magnitude larger. For some reason I feel as though I should buy a jar of that well known lubricant before I place my order for one of these cards. Much as I'd like to use the RF Tools, I just can't convince myself to waste that much money for that card.

Because it's a low-volume production optional accessory for a piece of laboratory grade test equipment that cost tens of thousands of dollars new.

SRAM cards have ALWAYS been comparatively expensive and low volume production but they provide easy to access execute in place memory (they're addressable as if they were RAM from a developer's point of view). My guess is that it was never a priority to move to a different technology because if you were paying for _insert-test-equipment-name-here_ then you didn't really care that the SRAM card cost 5x more than the flash equivalent.

That being said, I'm so far still too cheap to buy one but I'm getting close.

Mike is correct,
The big market for these cards is not test equipment but CNC machines (computer controlled melatworking mills and textile looms etc). The equipment is old but viable and mostly uses dedicated hardware. SRAM cards were ahuge step forward from the punched tape previously used. The user pay to keep them gonig because new ones cost hundreds of thousands of dollars. There is a cottage industry repairing the EL display screens used in these too. To get scale for the cost, just try pricing up 8Mbit of CMOS RAM chips. Even without the packaging into PCMCIA they are expensive. Or you could get a micro and build a simulator that buffered between DRAM and the PCMCIA port.....

Robert G8RPI.

Can someone please tell me why these miniscule (in capacity) memory cards cost so darn much? They want more for one of these than I paid for a memory upgrade for my laptop and that was several orders of magnitude larger. For some reason I feel as though I should buy a jar of that well known lubricant before I place my order for one of these cards. Much as I'd like to use the RF Tools, I just can't convince myself to waste that much money for that card.

Thanks for the replies; informative if not consoling! To add insult to injury, while scanning that infamous auction site yesterday, I saw a Leica brand SRAM PCMCIA card, 2M if I remember correctly, listed for around $570. GOOD GRIEF! I sure hope that was mistyped! That's as bad as the $750 microphone that Agilent wanted to sell me when I checked to see of they had any left in stock. Guess RF Tools will remain on the "wish list" for the foreseeable future. Thanks all,
Tom

From: c_day_nz
Topic: 796  Message: 796

I too would love RF tools but can't justify SRAM card prices. I wonder if any brains in the group could come up with a SRAM to FLASH adapter? Perhaps a group project? I haven't had allot to do with interfacing memory to uPs but would have thought such an adaptor should be possible ☐ small PCB that plugs into the 8924 PCMCIA, a pic/atmel to handle communication from SRAM to flash & a front accessible CF, USB, SD or TF socket. Maybe it could be based on something like http://teuthis.com/daisy/index.html - an open source MP3 player which reads file/s from flash. I'm guessing but I'd say allot of FLASH file structure will already be in the code. I'd certainly be more inclined to pay $100 for an adapter kit VS several hundred for an outdated SRAM card. Food for thought. 73s de Chris zl1cvd.

Hi,
In theory a passive compact flash to PCMCIA adaptor would work IF it used the CF card's linear mode. Unfortunatly all the commercail adaptors I've seen force the card into ATA (hard drive simulation) mode. With SRAM cards costing under £50 / $75 I've not put any more effort into it. A PCMCIA prtotype board costs more than the SRAM. I might find a readilly availabe ATA adaptor and try to modify it if there is enough interest.
For those in the UK /EU I can put an HP RF tools image on your SRAM card if you can't do it.

Regards,
Robert.

Tim saw your answer to Chris.

Glad to know. I was headed that way and getting ready to ask question. Price is not cheap, but not intolerable. I found some others in same price range but prefer a new card. Also 2 meg gives some wiggle room.

If changing the file extension to MP4 doesn’t work, you might need to DL it again. It should play in most any version of VLC or GOM.

Slight change of plan. Being as my webhost is not cooperating with the single large file, I removed it. In place, I added another set of smaller pieces to DL. These are from WinRAR, for those familiar with that, and should reassemble using either WinRAR or 7-Zip. Just another option to the original set that Joe created. They can be found here…
http://grovesnet.org/Downloads/

For those interested in getting it in one chunk, Jim has kindly uploaded it to his site here (and it’s working much better than mine did)…

# 805. .MV4 Windows Media Player Codec Pack

Yahoo group: hp8924
Date: 2012-04-05 22:01:07 UTC
From: Dawn
Topic: 805  Message: 805

I'm still running XP and followed the recommendation on Microsoft's XP support forum to download the Media Player Codec Pack from CNET's download website:

http://download.cnet.com/Media-Player-Codec-Pack/3000-13632_4-10749065.html?part=dl-&subj=dl&tag=button

During the installation it asks you to install a yahoo toolbar and trial version of a DVD utility which I unchecked.

The video plays just the way it is without renaming the .MV4 extension using the XP Windows Media Player. No need to install another player and seamless integration with the existing WM player.

# 806. HELP NEEDED

Yahoo group: hp8924
Date: 2012-04-07 01:36:28 UTC
From: Doug
Topic: 806  Message: 806

My first post to the group and I am looking for some help. I have come across a 8924c salvaged out of a Hp cell phone test bay. The unit has V.05.30 loaded so the boot up screen says. It also has a HP 83230a PCMCIA 64K SRAM card. It was last calibrated by Agilent in 2004. Everything else on the bay was calibrated at the same time by Agilent.

I do not know how to operate the unit. I haven't used sweep gear for some thirty years or so.. I do have a MINI VNA which does a good job with some filters and coax.

In an article written by Agilent ( I think ) they say they set the 8924c machines that they service or sell to hams up as a 8920B unit before they ship them out and then save the configuration to memory. This sets up the AF analyzer, TX and RX screens which are ready on boot up. This is just about all I would need. The question is, how does one go about setting these up. I have no documentation at all!! The original owners threw it all out.

As the unit is now, on boot up it appears to go through all the self tests without any failures. I think I should be able to put the SRAM card into one of my old laptops and read it. Haven't tried it yet.

Any help would be grateful appreciated.

Doug,
goto:
<http://groups.yahoo.com/group/hp8924/files/>

and log in with your yahoo groups user name and password. Download

08924-90038.pdf that's the user manual.

08924-90048.pdf is the Condensed Programming Reference Manual (if you want to program it in HP basic)

also download

8920A_B Application Handbook.pdf that's the "how to" book for general RF use once you figure out how to get out of the CDMA mode.

What is the first function you want to do?

cheers,
jim

# 808. Re: [hp8924] HELP NEEDED

Yahoo group: hp8924
Date: 2012-04-07 03:07:39 UTC
From: Ralph Mowery
Topic: 806  Message: 808

Go here for starters:

http://www.amtronix.com/8924cqs.htm

While there look around for more info on the 8924C.

While it is not exectally like the 8920 sets, go to the Agilent site and download the manuals for the 8920B.  Some of the buttons are in differant places and may be labled differant, but you should get a good idea.  The 8920C and 8920B are very similar to each other except the 8920B does not do the cell phones.

Also look on the page and especially the links at the bottom.  It will tell you how to make the 8924 turn on in the noncell phone mode.

http://www.amtronix.com/hp8924c60.htm

Most of the manual for the 8924C is mainly about the cell phones and not of much use to most people now.

The 8924C will work way below 30 MHz ( I think to about 400 KHz), but the input and output levels start to fall off below 30 mhz, but are close to being on at 10 mhz, below 10 mhz, the levels start to fall off.

The card is not needed, but can be used to store test proceduers.  That card slot can also be used to change the software in the test set.  YOu have a $ 49,000 pice of equipment when it was new.

Plan on spending about a week learning how to use it, as it will do almost anything you will need.

From: Tony Brignole
Topic: 806  Message: 809

Doug, the 8924 is a formidable uint and it took me about 6 months to really get comfortable with it.

Go to Amtronix and they have some pages with some good info. One is how to set the unit up so it comes on in the 8920 mode. I set the 8920 us as mode and use the recall so it comes on in 8924 mode then I go to recall and hit enter and it goes into 8920 mode.

Watch you're power level. Some units do high power some are only good for 3 watts. It should have a yellow tag on the N connector stating power. You can buy and retrofit higher power options if you only have a 3 watt unit. The high power adpators are not too expensive.

You're in the right place for help here and there are some guys far more knowledgable than me who can help you.

Thanks Tony. I will do that. The unit is the 3 watt one and I am
aware of the restriction.

Go here for starters:

http://www.amtronix.com/8924cqs.htm

While there look around for more info on the 8924C.

While it is not exectally like the 8920 sets, go to the Agilent site and download the manuals for the 8920B. Some of the buttons are in differant places and may be labled differant, but you should get a good idea. The 8920C and 8920B are very similar to each other except the 8920B does not do the cell phones.

Also look on the page and especially the links at the bottom. It will tell you how to make the 8924 turn on in the noncell phone mode.

http://www.amtronix.com/hp8924c60.htm

Most of the manual for the 8924C is mainly about the cell phones and not of much use to most people now.

The 8924C will work way below 30 MHz ( I think to about 400 KHz), but the input and output levels start to fall off below 30 mhz, but are close to being on at 10 mhz, below 10 mhz, the levels start to fall off.

The card is not needed, but can be used to store test proceduers. That card slot can also be used to change the software in the test set. YOu have a $ 49,000 pice of equipment when it was new.

Plan on spending about a week learning how to use it, as it will do almost anything you will need.

---
Thanks Ralph. I am looking forward to using the thing for sweeping filters etc and as a spectrum analyzer. To heavy to
take to a repeater site. Besides I can hardly lift the thing. It will take me a while until I can get it operational
for my use. Other then a little screen burn in, it looks to be in pretty good shape.

Thanks

Hi Doug,
Welcome to the 8924C club! To help with the screen burn you can use a converter (Gonbes 8200) on the composite output to drive a standard VGA monitor. Search the archive for video.

Hi Doug,
The GBS8200 (or GBS8220 with two VGA outputs) is a board desigined for use in old video games, old pc based machine tools with CGA/EGA and the like. They are available on ebay, http://www.ebay.co.uk/itm/CGA-EGA-RGB-VGA-GAME-video-converter-board-1-VGA-output-game-convert-GBS8200-/180833084570?pt=LH_DefaultDomain_0&hash=item2a1a7de49a or search item 180833084570. You have to add a sync separator (comparator or an LM1881). You can buy bxed units but they cost 5 times as much as the board.

# 816. Serial Port

Yahoo group: hp8924
Date: 2012-04-08 22:35:45 UTC
From: Doug
Topic: 816  Message: 816

The serial port has a telephone type jack on it. The cable I have has it wired to a 15pin connector that normally plugs into the PCS unit. That has been tossed aside. I take it that a custom cable can be made and then plug that into a standard 232 port. I noticed that there is a binary file posted that is newer then what I have in my unit. I am assuming that it has to be loaded via the serial port with unknown software.

I am making progress. I have the "powron" programmed in and finally found it. I can generate and open my repeater, so after supper its the spectrum analyzer and the duplex port to be tackled.

Thanks
Doug VE5DA

You can go to the files section in the 8924 Yahoo group and download:

bts_sw.zip

If you know what you are doing I guess that it is useful for other things, but I use it to do a print screen of the 8924 to a laptop.

There is a wiring diagram in some of the files.  YOu can make the cable out of  what looks like a 6 pin (think that is the number) plug that looks similar to a  4 wire telephone connector  and the serial plug.  I would call it a db9, but someone pointed out that there is no db9, but many people call it that name.

Someone did a good job of converting a vidio file that takes about half an hour to download.  It is for the 8920, but much of the information will apply to the 8924.  I wish I knew where the file was at so I could point it to you.  Maybe someone else will.

Doug,

IF you are using Windows XP, then most any of the addon codec packs available will work.
The alternative is to use a player like VLC or GOM.

Vista, 7, and Ubuntu have no problems playing it with their respective built-in players.

More information about the video can be found in the following threads...

# 827. Measuring Coax wavelengths with RLB

Yahoo group: hp8924
Date: 2012-04-11 04:18:36 UTC
From: Tim
Topic: 816  Message: 827

Hi Folks,

I'm working on a phasing network for a couple of antennas, and was wondering if I could measure the 1/2 and 1/4 wavelength lengths of coax in the following way:

Hook up the RLB as normal. The DUT side goes to a PL259 'Tee" connector. One side of the T goes to a 50 ohm load, and the other side goes to the 'unknown' length of coax.

I'm doing this, but the lengths calculated vs measured vary a bunch.

For example: Some Mil RG-214 (not Mil 'type'), I physically measure 100 inches.

Using the 8924 & RLB, the 1/4 wave frequency is 37.5mHz.

37.5 mHz 'should' have a length of 78.7 inches.

ideas?

Thanks,

Tim W5FN

I would think that if your configuration is as I understand it the 1/2 wave would present a high impedance at resonance across the 50 ohm load assuming it was an open circuit piece of coax.
Either side of this the impedance would be lower effecting the return loss.

Attachments: 1 described; binary payloads are missing from this source WARC

Looks like I had the RLB hooked up wrong.

I've changed things around, and it appears to be doing
just what I want. (I don't have access to a VNA).

Now, physically measuring the RG-214, I get 100 inches.
Per the notches, I get 19.4 mHz as the 1st notch. This
tells me that the electrical length is 152 inches.

152 x 0.66 = 100.3" Pretty close!

Not sure if the picture will make it, but here goes:

If the pix doesn't make it, I'll put it up under files.

From: Tim
Topic: 816  Message: 831
Attachments: 1 described; binary payloads are missing from this source WARC

Well, turns out that wasn't quite right.

The original diagram only gave 1/4 and 3/4 wave
nulls. This drawing (based upon two different
applications of the RLB) should give 1/4, 1/2, 3/4
and full wave nulls.

Somebody please chime in and let me know
what you think.

(still looking for a painless way to make 1/4 wave
and 1/2 wave stubs - without a VNA).

Thanks!

Tim

Hi Tim,
Try using just the Tee (or a reistive power divder) between the TG and SA with the stub on the side arm, no return loss bridge. You should see the suck out just fine.

There's someone on Flea-bay that's selling brand new,original HP packaged RJ serial to DB9 cables with a ferrite core for $15. Had I not ruined a perfectly good serial cable and crimped on a connector, I would have rathered picking up one of these.

http://www.ebay.com/itm/HP-Cable-8920A-8920B-8922-8924C-Agilent-NEW-/250602872434?pt=LH_DefaultDomain_0&hash=item3a59185e72

# 836. Inexpensive RLB Source

Yahoo group: hp8924
Date: 2012-04-13 08:12:31 UTC
From: Dawn
Topic: 836  Message: 836

I found this source from a mention on another board.

http://preciserf.com/shop/

They have two RLBs that appear to be a good value if you're not going to work above 500mhz. One has an internal 50 ohm termination, the other is a 4 port that lets you use other references, but's limited to 250mhz. For around $100, they look like a good starter bridges if you can't afford a high end one and don't have any need for the upper end of the spectrum. The cases look like stock Pomona die cast boxes, so they probably are heavily built.

I think that is the standard cable that comes with the Cell
Maintenance package. Mine had that on. I'll just get a
mating 15 pin D shell and break out both ports...

Seems pricey to me if all you need is a simple directional coupler.

How about a MiniCircuits ZFDC-10-21 for $55? Good to 1Ghz too.

I have one of these are its quite well made.

Hi All:

Just a thought for your consideration:

Many of us who own these great test sets are in the market for an RLB to complete our arsenal. One of the places to acquire same is eBay.

Rather than bid against each other (unknowingly) and forcing the price way up, how about we post a note on this forum with the eBay item number when we make a bid and the rest of us agree not to bid on the item? First guy to post on a given RLB gets the green light.

Am I dreaming in technicolor or does this notion have some traction?

One that is good enough for ham use is a Mini-Circuits ZFDC-20-5.
Covers up to 2000 MHz.  Should be under $ 100.

I bought two band new Mini-Circuit RLDB zdf-20-5 ??? with N connectors for less than $20 USD shipped on ebay. They work fine for what I do.

Being a seller on ebay I don't care for the notion of people getting to together a keeping the price down, if it is more than you want to spend don't buy it or wait for another. One think about ebay there will always be another. And yes you have to cough up money sometimes!

But that is my 2 pieces of copper and zinc

I don't think the ebay collusion would work at several levels.
There are other options.
1 Make your own. This is not too difficult. a couple of resistors. some minature coax and a bunch of ferrite beads or a small rf transformer (and careful construction). There are lots of designs on the web. As noted below, we may not need utimate performance.
2 Use a hybrid power divider/coupler (mini-circuits etc). These have the same basic layout as a RLB. Many of us have them already and they cost less.

Most of use don't need multioctave sweeps so 2 or 3 units to cover areas of interest will give better performance. for instance sweep your hybrid s and just use them were the isolation is best.
Using RF tools with an 8924C gives us a big advantage as we can get automatic calibration. Thus ultimate flatness and accuracy is not so important as in some applications.
Robert.

DREAM ON! You obviously have infinitely greater faith in humankind than I do (fully unjustified, I might add). EVEN if the members of this list complied with an agreement such as this (which I seriously doubt), what's to stop the lurker from profiting from the information posted here and leaving the members of this list sitting empty handed (albeit a bit richer - NOT completely bad, I guess)? Either way a bad deal for all.

"Whilst we all like to get things cheap, colluding like this at a traditional auction (In Australia anyway) is illegal. It isn't fair on the seller either :-("

Here I draw the line. After my last "experience" trying to buy the necessary accessories for my two newly acquired Spectras, I'm afraid that this is a bad time to plead "fairness for sellers" to me. EVERYTHING I found listed that was worth looking at had at least one, and sometimes more, key parts missing. Now, I'm NOT talking about parts that were sold as extra items by the manufacturer. I'm talking about things like the locking clip for the plug that plugs into the control head, the speaker mounting bracket and thumbscrews, etc, etc. Things that were supplied as PART OF THE ITEM when purchased from the factory. And, interestingly, there was ALWAYS SOMEBODY ELSE that "just happened" to be listing the "missing items" at the same time! HOW FORTUNATE FOR THE BUYER!!! So, as I noted in the previous thread, while I know that this plan wouldn't work, it has ABSOLUTELY NOTHING to do with ANY concern for an auction seller. Fairness is a TWO WAY STREET!

# 851. Return Loss Bridge

Yahoo group: hp8924
Date: 2012-04-21 22:22:54 UTC
From: Tim Campbell
Topic: 851  Message: 851

I am planning to purchase an RLB and RF tools software for use with my 8924c. I am looking for input on the different RLB's out there. I am considering the RLB-E from precise RF : http://preciserf.com/shop/rlb-e-return-loss-bridge-2-500mhz-external-reference/ at $105.00

or the Amtronix SW1200N: http://www.amtronix.com/sw1200n.htm at $189.00.

The usuable range seems to be more on the amtronix model. The model above from precise RF uses an external reference load so I could use it for 50 and 75 ohm cable assemblies.

Does anyone have experience with both of the above units or can you comment on one of them? Other suggestions welcome too.

Thanks.
Tim KB2MFS

From: Robert Atkinson
Topic: 851  Message: 852

Hi,
I've no experience of either unit but have looked at both. I'd go for the Amtronix version. It has a range that is applicable to the 8924C and comes with individual performance information. The size tells a lot. I feel that the RLB-E is a little too compact to have a good layout. The option of an external load is a mixed blessing. It is an other variable and as the RLB-E appears to have balance trimmer capacitors on the reference and DUT ports its possible that you will not get best performance unless you use a similar load to the one it was adjusted with. Also you will not great performance with a 75R load as the internal power splitter resistors will still be sized for 50R.  Why not buy the 50R Amtronix and build your own 75R bridge? You could then include 50 to 75R resistive matching with 6db loss on the Source and Detector ports to match the 8924C port  impedance and replace the 6dB attenuators recommended by HP. With an 8924C, a couple of attenuators, 50R (75R) terminaton, short/open and some leads you have all the tools you need to check the performance of your homebrew RLB.

HTH,
Robert G8RPI.

Subject: [hp8924] Return Loss Bridge

I am planning to purchase an RLB and RF tools software for use with my 8924c.  I am looking for input on the different RLB's out there.  I am considering the RLB-E from precise RF : http://preciserf.com/shop/rlb-e-return-loss-bridge-2-500mhz-external-reference/  at $105.00

or the Amtronix SW1200N: http://www.amtronix.com/sw1200n.htm  at $189.00.

The usuable range seems to be more on the amtronix model.  The model above from precise RF uses an external reference load so I could use it for 50 and 75 ohm cable assemblies.

Does anyone have experience with both of the above units or can you comment on one of them? Other suggestions welcome too.

Thanks.
Tim KB2MFS

# 853. Someone to program HP RF Tools to a card

Yahoo group: hp8924

# 860. Re: HP 8920

Yahoo group: hp8924
Date: 2012-04-23 02:30:29 UTC
From: radioman762
Topic: 853  Message: 860

The HP8935 units are indeed "extremely similar." I have one, as well as a 8924C. Many of the modules are identical. This has helped me in trouble-shooting by permitting substitution of a known-good module from a working unit into one that had a problem. From the part numbers on the modules, many originated in the 8920, even if they are also found in a 8924 or 8935.

Some of the modules that are not identical can be swapped between the models for the purpose of upgrades or adding features. For example, you can replace the 30 / 230 kHz receiver in the 8935 with the 15 / 230 kHz receiver used in the 8920 and 8924. Similarly, the 8935 frequency reference standard can be upgraded if desired.

While it is certainly up to the List Owner to determine what discussion topics are appropriate, it looks like that all of the 89XX models are very similar and that the underlying hardware is the same. The differences are in the firmware, the mix of modules, and sometimes the display type.

Thus, it will be very helpful for all of the 89XX models to be accepted as legitimate topics for discussion. It would also be helpful to create an area in the "Files" section where manuals for the various models could be posted. There is a lot of overlap and sometimes features common to more than one model are not fully documented in all manuals.

Robert I have a HP 83230a PCMCIA card with nothing on it. The
batteries dead. What I was
wondering is what size card is required for HP RF TOOLs. This card is
a 64kb card.
I haven't figured out how to use the test set but from just playing
with it I can see
where the RF TOOLS program would be a big help..

Thanks

Hi Doug,

I believe that it is 'normally' put on a 512k card,
but mine is on a 2mb.

I don't think it will fit onto a 64k card.

Greeting All
I have been following the thread in reference to RF Tools for the 8924. I have a 8924 in Montana at my son's home N7XVF. It has RF Tools on a PCMIA card.
I am looking for a card for the 8920 A. It uses a card similar in style to the PCMIA but I believe it is called a Epson Card.
Does anyone have any information.

Ralph, W7HSG

I have also witheld posting regarding the E8285a. I own an 8924c as well, but also own a E8285 for about 3 years prior. Outside of Brian's videos on Utube, there's virtually no reference or knowledge of the unit on any amateur or test equipment forums. Everything I learned on using it came either from an 8920 or E6380 manual.

From: Robert Atkinson
Topic: 867  Message: 867

Hi Ralph,
It is an odd format, 40 pins in a single row. The cards are rare and programmers even rarer. One option would be to program the image into a 4Mb (512MB) EPROM or EEPROM and hard wire in internally to the A7 card with a switch on the chip select to switch it in and out. Most of the connections could be done by "piggy-backing" the chip onto another ROM or perhaps there is an empty socket. The A7 circuit is in the published CLIP. Unfortunatly when I had a 8920A I didnot have the ROM image so never tried it.

Thanks Robert,  I may have to take you up on the offer even with the high postage.

 I have a 2 MB card.  It seems to work as I can save from the 8924 to it,  I did get access to a laptop that had a pcmcia slot in it.  Used the memory card manager and put the RF tools iso file on it.  It seemed to go on the card and I could read it back.  When I put it in the 8924, it will not read it,but gives an error 85 code.  Do you have any hints for this problem ?

Make sure you extract the ISO file before you program it to the card, the 8924 wont know what to do with an ISO. There is a straight binary version in the files section.

Topic: 796  Message: 873

I bought one just like it and it also worked for me.

I had a couple of bad starts with for some unknown reason, but I think it was me as this was the first time I had used the Memory Card manager. Third try at putting the program on and it works fine.

I think it was about $ 70 plus a couple of bucks to ship it. The battery in it was dead, but a new one was included in the package.

Hi,
Yes the 85044A will work fine. Just put a 50R termination on the incident port. It does not even have to be a high quality load, it's not the reference of the bridge.. The input power splitter will effectively replace the 6dB attenuator recommended on the RF duplex port of the 8924C.

Robert G8RPI.

# 876. Calibrate watt meter?

Yahoo group: hp8924
Date: 2012-05-09 02:11:08 UTC
From: ki0eo@hotmail.com
Topic: 876  Message: 876

Hello all,

Does anyone know how to calibrate the watt meter in the HP8924C?
I installed the 100 watt attenuator some time ago.
I also loaded the calibration data.
I primarily work on UHF radio equipment.
I discovered my 8924c is pretty accurate in the UHF range (444.000) but is off quite a bit in the VHF (146.000) range.
I've zeroed my power meter and ran the complete self test and everything passes ok.
I have also scoured my service manual and am unable to come up with a calibration procedure.

Thanks,
Don

Topic: 876  Message: 877

I do not know of a way to calibrate the 8924, but was interisted in how far your 8924 seems to be off.

My 8924 started off as the 3 watt unit and I put in a 60 watt load and calibration data.

I did a few quick checks with mine compaired to an old Struthers inline meter that I bought as new surplus about 10 years ago.  It was still in about 3 layers of military wraping when I bought it. I seldom use it, and it still looks almost new.

At 150 mhz, it was within about 3 watts from 50 to 5 watts.
At 450 mhz, it was within one watt from 20 to 5 watts.

It seems that much of the equipment to generate low level signals is very close.  I have an old Motorola generator like you often see in the Mastr ll books and the uv output seems very close to the modern test sets.  Most wttmeters seem to have a big differance in what they show.  I guess they are not calibrated very well over the whole frequency range.

Hello all,

Does anyone know how to calibrate the watt meter in the HP8924C?
I installed the 100 watt attenuator some time ago.
I also loaded the calibration data.
I primarily work on UHF radio equipment.
I discovered my 8924c is pretty accurate in the UHF range (444.000) but is off quite a bit in the VHF (146.000) range.
I've zeroed my power meter and ran the complete self test and everything passes ok.
I have also scoured my service manual and am unable to come up with a calibration procedure.

Thanks,
Don

Hi Ralph,

At 450 Mhz my Bird watt meter reads 38 watts and my 8924c reads 38 watts.

At 150 Mhz my Bird watt meter reads 40 watts and my 8924c reads 33 watts.

I discovered this when I helped a friend of mine align his VHF MSF5000. We set the power level with the 8924c and when we finished we put a Bird watt meter on and discovered the error.

This monitor has to have an alignment somewhere.
I upgraded to a 100 watt attenuator and installed the cal data but never did know where to align it at.

# 879. OT 8922 help

Yahoo group: hp8924
Date: 2012-05-10 04:39:40 UTC
From: Glenn Little WB4UIV
Topic: 879  Message: 879

I have a 8922M that has an IF Link as the primary RF input.
The CRT is badly burned.
The front bezel is cracked at one screw hole.
It has option 006 (spectrum analyzer)
I also have a 8922S that has a 15 Watt input.
The CRT on this service monitor is only slightly burned and the bezel is ok.

Can the front end that allows 15 Watts be moved to the monitor with
option 6, or, can I move the spectrum analyzer into this monitor?
Is a firmware update required for the spectrum analyzer?
Is recalibration required to change the power handling capability (as
well as the proper hardware)?

Wish I could find a full service manual for the 8922 series.

Thanks
73

Hi Glenn,
The Spectrum Analyser Module from the M will fit straight into the S. I do not know if you need to run a  calibration program. Try it and see. I'm pretty sure the calibration/assembly level maintenance manual is out in the public domain. I'm away from home so don't have access to my files to check. Moving the attenuator from the M to the S will need a calibration file. you may also have to swap the input module and that is a lot of work. Keep the S and rob rhe M.

Robert G8RPI.

From: Tim
Topic: 730  Message: 881

Hi Folks,

I'm trying to setup the duplex mode so I can check out a repeater - setting levels, etc.

However, on the duplex screen, I don't see any provision for putting the second audio generator on the signal.

(I need both a sub audible 'PL' tone, and the 1kHz tone).

I figure there's some way to do it, just not sure how.

Thanks,

Tim

I'll give it a try later.

Tim W5FN

Tim,

Working from memory here (and you know how dangerous that is), but I think you can go back to the Signal Generator screen and enter the 2nd tone, then go back to duplex. I know I've done it... just can't visualize it for sure without the instrument in front of me.

They seem to have hidden that one.  Go to the RX TEST screen and set the tones where you want them.  Then on the duplex screen make sure the middle block that says AF GEN TO is set to FM.  It may default to audio out.

Hi Don,

It does seem odd that the wattmeter part of the 8924 would be ok at 450 and off that much at 150.  Have you checked the Bird with any other meter to see if it is accurate at 150 ?

Did you check the power with the Bird between the 8924 and transmitter, or did you use an antenna or other dummy load ?  Also did you check for reflected power with the Bird ?

de Ralph

Yes, 2 bird meters, precision dummy load and also an antenna.
I agree it is quite odd that it is good at 450 and not 150.
Gotta be some way to calibrate it.

I do not have a way to generate any power past the 450 band to run a test.  It would be interisting to see if the 8924 is off by very much at the high end at 900 mhz.

It might be asking too much for the 8924 to measure power from 30 to 999 mhz and be accurate at each end.

I do not normally get too excited about the ammount of power showing on any wattmeter. About anything within 10% is about all I worry about.  Usually all I care about is getting close and tuning for maximum out or minimun comming back.

Where I work I often deal with electronic measuring instruments calibrated to .5 % or less.  The thing that I understand,but drives some of the engineers batty is the temperature.  The instruments will readout to two decimal places, but the thermal couples are only good for about 3 degrees at 300 deg. C.  When two or 3 are in the same 1/4 inch probe and off a degree or two, the engineers just can not understand it and want them to read the same.

I was fortunate enough to own a calibrated, Boonton RF power meter. The initial cost to calibrate and repair the meter was $700.00 and $300.00 to calibrate it every year. The sensor is good to 10GHz.

I calibrated my unit by setting the frequency and then check the levels using my HP generator and the power meter. I have different correction factors for each frequency that are saved in the setups. I have a file in the files section that shows my 300 watt setup using an external attenuator and how to set the correction factor.

The 256 K cards are not big enough to hold the RF Tools program.
You need a card that is atleast 512K.  You can use a larger card if you want to.  I used a 2 MB card like someone else used and it took the program fine.

Hi,
Will the PCMCIA adaptor work with the 8920B / 8924C? is it read and write in the test set? Any idea of cost?
Sounds like you have put a lot of effort into this. There is the physical PCMCIA interface, USB host, Buffer memory and dealing with the FAT on the USB key. I guess the FTDI Vinculum chip would do a lot of the work but I've never used one. The only PCMCIA break-out I've ever found was a Digi-Key one at nearly $200.

Regards,
Robert G8RPI.

I saw messages here that said many of the internal modules were interchangeable between the 8924C and the E8285A. Is this true of the 60W/100W attenuator upgrades? I know that HP didn't offer this upgrade for the E8285A.

I've seen the other attenuator upgrade methods some have used and posted about. I'd really like to know if the official 8924C upgrade will fit the E8285A.

I don't have an E8285A or 8924C yet, but soon I'll have something. I'm leaning toward the E8285A. Of course, if I could afford a 8920A or 8921A, I'd get one of those.

I don't have a 8924C to test with but I don't see why not unless its a different type of PCMCIA than the 8935.

# 906. Re: Duplex mode

Yahoo group: hp8924
Date: 2012-05-25 00:21:07 UTC
From: willcoele@ameritech.net
Topic: 730  Message: 906

Press SHIFT then AF/ANL to enter the encoder screen. Select Func Gen and setup Generator 2 for a sinewave and your PL frequnecy. Select AFGen2 To FM and set the deviation to .5 or .6 KHz.

When the RF Generator output is connected to the Duplex out, this will setup Generator 2 for a PL tone. In the Duplex screen you can setup AFGen 1 for any frequency or deviation with out affecting the PL tone.

# 908. EDACS tests

Yahoo group: hp8924
Date: 2012-05-27 04:19:38 UTC
From: mojoehand
Topic: 908  Message: 908

At work, we have an 8920A and the EDACS test software on memory card. I borrowed a 9121 HPIB floppy drive (I can't find a 9122C locally). I tried hooking up the floppy to the 8920A, but I don't see how to initialize a disk or to transfer files.

The goal is to load the EDACS programs into memory and save them on floppy. I think the 8920A supports the DOS filesystem, so I should be able to read the disks on a PC. If the 8920A only supports LIF, I should still be able to read the disks on a PC using HPDir.

Does anyone know how to accomplish this?

Since the 8920A memory card is not PCMCIA, going the floppy route seems like the best way to make a backup copy of the EDACS software.

# 910. 11807Eopt100.bin

Yahoo group: hp8924
Date: 2012-05-27 04:32:57 UTC
From: mojoehand
Topic: 910  Message: 910

I just uploaded a Zip file containing all of the files that are in the 11807Eopt100.bin file posted here. This should make it easier to simply copy the files to a PCMCIA card and not have to deal with "image" software.

I haven't tried using these files yet, as my E8285A hasn't arrived yet. However, all of the program (PGM) files look correct and load into a text editor just fine (It's been many years since I programmed in HP BASIC). The other files load as binary, but they also look as I would expect.

After my E8285A arrives, I'll order an SRAM card and give this a try. In the mean time, feel free to try it yourself and report back.

BTW, when I previously asked about getting the NA FM tools, I was told that they were also in this RF Tools image. As you can see from what I extracted, they are indeed. Two for one :-)

From: Robert Atkinson
Topic: 908  Message: 911

Hi Joe ,
Chapter 6 of the 8920A programmers guide explains disk access. The "InstrumentBASIC User's Handbook" give more general information. It is done primarlly through the TOOLS menu. While the 8920A will support DOS (FAT) format on the SRAM card, it expects program cards to be in LIF format.

To convert from a 8920A (Epsom 40pin) program card to a 8920B PCMCIA you could read from a 8920A to an external LIF drive then connect the drive to a 8920B (or 8924C) and write to a PCMCIA card. A binary copy of the PCMCIA could then be made in a PC with MCE and used for making more copies. Not sure if HPDir will support writing LIF to a PCMCIA SRAM card in a PC. There are also the HP SDF utilites
ftp://ftp.agilent.com/pub/mpusup/35670A/SDF_utilities/

HTH,
Robert.

I had an extra 256K card and tried the files you uploaded.  They seem to work fine.

I am having issues with the NA FM tools part.  I am using a 8924C to do the testing with. I have not been able to get the NA FM to work off the origional bin file that was posted here either, but all the other programs work.

I thought it might be that the program is looking for the 8920 instead of a 8924C so I changed all the places where the 8920B was to 8924C in the program.  Still did not work.  I have been getting an ERROR 18 in 1356.  I did delete that line, and the program ran without errors showing.  When I ran the test, it acts as if there is no output from the RF port of the 8924C.  There must be a place that tells the program what port to send the RF to .  I am not familiar with the IBASIC to find that spot.  Been about 25 years from the last time I used even regular BASIC programs.

Good to know that the files work (mostly). As for the NA FM tests, Rick from Amtronix had this to say in an email to me:

"NA FM tests is on our card too but there have been issues getting it to work."

I didn't get any further explaination as to what the issues were. If the problem is in the IBASIC programs, then it should be fixable. If the problem is in a library file, then probably not.

# 914. Re: EDACS tests

Yahoo group: hp8924
Date: 2012-05-27 21:58:57 UTC
From: mojoehand
Topic: 908  Message: 914

It seems that the 9121 drive is not CS/80 compatible, so it won't work. I don't know of anywhere locally to get a 9122C drive. I've looked on the net, but everyone wants serious money for these drives.

I don't need the EDACS tools myself. Besides, the E8285A I have coming won't do EDACS. I was just interested in making a copy in case others here had a use. If someone can suggest an alternate method that isn't too much trouble or expense, I'm all ears. Otherwise, I'll just forget it.

Someone mentioned reading the Epson memory cards with an EPROM programmer via an adapter. I have this programmer: http://www.mcumall.com/comersus/store/comersus_viewItem.asp?idProduct=4312. If someone can tell me how to wire an adapter and what device setting to use to read the card, I could try it.

The NA-FM file on my card is the original binary file that I uploaded to the files section. It loads and runs on my 8920B without error. I do not have a cable made up to test any radios but it will generate a signal and measure power and report test failures on the other items, so I believe it will work correctly if I ever need to use it. I have used Memory Card Explorer to write the binary file to several cards without any problems.
I erased the card and wrote the file exactly as it appears in the files section. I am not sure what problems "dealing with image software" that moejoe is referring to. It seems to be a simple and straight forward process. I guess it could be a compatibility issue with the 8924.

I didn't say there was anything wrong with the original image. I just thought that copying the files straight across to a PCMCIA memory card would be easier for some than using special software to write the image file. I was simply providing an alterative, based on the original image. Choose whichever method that works for you.

Also, copying the files to a formatted card that is larger than 512 KB will leave the rest of the card free for storage of other programs and data, if desired.

As for the 8924C not running the NA FM code, that is an entirely different issue. From a cursory glance at the code, it seems that there are some differences between models that have to be accounted for in the code via assignment to strings of different lengths (error 18 is a string overflow). Since this will probably also affect the E8285A, I'll probably spend some time looking at this later. The code is terse and poorly commented and I haven't dealt with HP BASIC in over 25 years, so it may take some time coming up with a fix.

It seems that having the separate files instead of the 512 KB image has already been of use to at least one person. As Ralph states below, he copied the files to a smaller 256 KB card. This would not have been possible with the image file. Again, not better or worse than the original image - just an alternative to fit different circumstances.

I think it has something to do with the 8920B and 8924C using some differant commands in part of the program.  The bin in the files section loads fine on my 8924C and everything but the NA FM works.  Also  the individual files  that were just put in the files section works except the FM NA.  One thing about the individual files is that you can load just one program on a smaller card.  I had the RF Tools running off a 256 K memory card.

I took out a line that I was getting an error in and the program starts up and seems to run except no signals seem to be sent out of the 8924C ports so it thinks the receiver under test is not working.

One thing that makes me think it must be something about the program and the way it is written is that it mentions the 8920B and another set that I do not recall the numbers of.  There must be some minor differances in the way the 8920 and 8924 sends the signals to the output.  Maybe that electronic vers mechanical input circuit  ??

I do want to think you for putting the program up.
Also to the one that said not all computers with the pcmcia slot will program all the cards.

The NA-FM file on my card is the original binary file that I uploaded to the files section. It loads and runs on my 8920B without error. I do not have a cable made up to test any radios but it will generate a signal and measure power and report test failures on the other items, so I believe it will work correctly if I ever need to use it. I have used Memory Card Explorer to write the binary file to several cards without any problems.
I erased the card and wrote the file exactly as it appears in the files section. I am not sure what problems "dealing with image software" that moejoe is referring to. It seems to be a simple and straight forward process. I guess it could be a compatibility issue with the 8924.

Hi Joe,
If you have a PC with an HPIB card you could try the HPDrive emulation software. Don't do it on my account though, I've no interest in EDACS. Perhaps you should ask if any one has an need before spending any more time on this. Thanks for all your efforts so far.

Robert.

Subject: [hp8924] Re: EDACS tests

It seems that the 9121 drive is not CS/80 compatible, so it won't work. I don't know of anywhere locally to get a 9122C drive. I've looked on the net, but everyone wants serious money for these drives.

I don't need the EDACS tools myself. Besides, the E8285A I have coming won't do EDACS. I was just interested in making a copy in case others here had a use. If someone can suggest an alternate method that isn't too much trouble or expense, I'm all ears. Otherwise, I'll just forget it.

Someone mentioned reading the Epson memory cards with an EPROM programmer via an adapter. I have this programmer:
http://www.mcumall.com/comersus/store/comersus_viewItem.asp?idProduct=4312. If someone can tell me how to wire an adapter and what device setting to use to read the card, I could try it.

Thanks for the reply,
I am trying to learn some more about these things. I didn't think that a fat formatted card would work in the HP equipment is that what I am reading in your reply? Also it sounds like a good idea to be able to separate the programs. I am using several different SRAM and EEPROM cards card that I erased and copied the image to. One of the EE cards had the cellular test stuff on it that I dumped. This card works fine but you cant save setups on it as it seems the 8920B wont write it. I would like to try the edacs code as my 8920B has that option and I have a drawer full of edacs radios.

Thanks for your work Joe and keep it coming.

In a message dated 5/27/2012 7:06:12 P.M. Eastern Daylight Time, mojoehand@... writes:

I didn't say there was anything wrong with the original image. I just thought that copying the files straight across to a PCMCIA memory card would be easier for some than using special software to write the image file. I was simply providing an alterative, based on the original image. Choose whichever method that works for you.

Also, copying the files to a formatted card that is larger than 512 KB will leave the rest of the card free for storage of other programs and data, if desired.

As for the 8924C not running the NA FM code, that is an entirely different issue. From a cursory glance at the code, it seems that there are some differences between models that have to be accounted for in the code via assignment to strings of different lengths (error 18 is a string overflow). Since this will probably also affect the E8285A, I'll probably spend some time looking at this later. The code is terse and poorly commented and I haven't dealt with HP BASIC in over 25 years, so it may take some time coming up with a fix.

# 921. Re: [hp8924] Re: 11807Eopt100.bin

Yahoo group: hp8924
Date: 2012-05-28 14:15:28 UTC
From: Ralph Mowery
Topic: 910  Message: 921

I have just started to learn about the programming also.  If you have a file, I guess that you could even write a program using Word or Notepad, and save it just like any dos program.  You may have to watch the file name so that the 8920 will read it.

The bin file works fine also doing the memory card explorer thing except that NA FM program.  I think that is because I am using the 8924C instead of an 8920.

Anyway what I have been doing is to take the files that were just put into the file section and loading it off the internet and putting it on a 3 inch floppy (dos format) and taking it to a laptop that has the pcmcia slot in it.  Then just using the explorer program to drag and drop the programs that I want to a card.  Works fine in the 8924C that I have except for that NA-FM program. The RF Tools work fine.  So does the other programs that are on the card.
 I am sure there is some kind of programming issue that is not compatiable with the program and the 8924C. It may have to do with the electronic attuenator and mechanical one, don't know.  I did take out a line using the Word Pad program and save it back to the card. The program will run,but for some reason it will not put out any RF signal to the receiver under test.  There is a screen that comes up like an audio level meter, and just on the white noise out of the receiver, it goes up and down with the volume.

Here is what the programming manual that you can download from the Agilent site says about the file format.  I think the 8920A defaults the opposit way.

The HP 8920B’s default file system is the Microsoft Disk Operating System (DOS). The DOS file system is used on IBM compatible personal computers. See "DOS File Naming Conventions" on page 282 for further information on the DOS file system. This implies that the HP 8920B expects a DOS formatted media for operations as shown in table 29 on page 272. If a LIF formatted media is used for the activities outlined in table 29 erroneous operation will result, with the exception of IBASIC mass storage operations. The IBASIC file system supports both LIF and DOS. The media format (DOS or LIF) is determined automatically by the IBASIC file system when the mass storage device is first accessed and the appropriate format is used from then on for IBASIC mass storage operations. File system operation defaults to DOS upon exiting from IBASIC.
NOTE: The IBASIC INITIALIZE command defaults to LIF format. Any media (RAM Disk, SRAM Cards, External Hard Disk Drive, or 3.5-inch floppy) formatted using the default conditions of the INITIALIZE command will be the LIF format and will be unusable in the HP 8920B, except for IBASIC mass storage operations. Refer to "Initializing Media for DOS or LIF File System" on page 288 for information on formatting media for the DOS file system.

I am not sure what you are trying to ask.
If you look here, you can see how to make the set come up like you want it to when first powered on.

http://www.amtronix.com/poweron.htm

YOu do not have to use the values given, but you can subistute your own.

If you set up a screen like you want it, you can use the same procedure, but use something else becides powron.  Then when you press the TEST button (top row,just to the right of the middel) you will beable to chose the preset screens.

The HP 8920A training video mentioned here is a good introduction. Also, you can download "HP 8920A Application Handbook" from Agilent.

A more generic source is the "Land Mobile Radio Test and Troubleshooting Handbook" which I have just uploaded to the files section.

The 8924 (and the 8920 I think) has 2 audio generators, AF1 and AF2.
AF1 usually is set to generate 1000Hz and AF2 is normally used to produce
CTCSS tones in LMR testing.
By using the encoder screen you can select other analog and selected low
speed digital signalling formats such as DTMF,.2 tone and 5/6 tone
signalling, and DPL. The encoder screen uses AF2 as it's generator.

To do 2 tone sequential and CTCSS I would set up the 2 tone page
(frequencies and timing info and level) in the signalling menu then set up
the CTCSS tone info (frequency and level) on AF1 in the RX screen. You
might have to be in the signalling screen to start the 2 tone sequence; I
can't quite remember and I'm not near the instrument.

Note that you cannot mix together two formats that are generated in the
signalling menu; thus if you needed to test 2 tone sequential and DPL it
cannot be done without an external generator for one of the formats. Also
if you are trying to generate what Motorola called Quick Call (not Quick
Call 2) also known as Chord Tone or 2+2 paging I am fairly certain that you
are out of luck. It would be possible to generate one pair of tones at a
time using AF1 and AF2 so the group call function could be tested but I'm
fairly certain that the individual call function cannot be generated.

I know this is a slightly old thread, but I have a question about the Eiger cards. Do they have attribute memory? Two ways to tell: you can read the card in a laptop running Windows; in Memory Card Explorer, while exploring the card, check the attribute option to see manufacturer and other data.

I'm surprised that there hasn't been more posts in response to your question. I'm still learning to use mine but I'll offer a couple of things.

You can use the TX Test screen and the SA to check frequency output, taking the usual precautions when feeding power into the instrument. Use the AFGen 1 and/or 2 for ctcss testing.

It is worth spending time in the manual to learn the functions. I would recommend downloading the manual for the HP8920 from Agilent. The RF tests are identical to the 8924 but you don't have to wade through all the cellular stuff.

Look in the archives here: someone was working on duplicating/uploading an instuction video.

As Brian mentioned, he has very helpful videos on Youtube.

Regards,

Paul

To setup the frequency measurement press the "TX TEST" button. Then move the cursor to the TX FREQUENCY. Press the "SHIFT" key then "INCR/SET" (METER) to change from a digital readout to a meter. Press the "SHIFT" key again, then press "INCR 'divide' 10" (REF SET)and enter 500. The meter should read from -500 to +500. Using the "INCR/SET" (METER) button, you can also set up a meter power measurement in a similar manner.

The unit can measure the CTCSS tone frequency but as fas as I know, it can't do a CTCSS tone squelch. Press the "RX Test" button and move the cursor to Filter 1. Select <20 Hz HPF. Move the cursor to Filter 2 and select 300Hz LPF.

Press "SHIFT" then TX/TEST (DECODE) Move the cusor to Mode and select Func Gen. In the Func Gen screen "AF ANL IN", select FM Demod. You can also set up the "Gate Time" and "Input Level".

If the TX "Tune Mode"in the TX Test screen is set for Auto, It will find the transmit frequency and the Decode screen will show the CTCSS frequency.

The Tune Mode should be in Manual and the meter should be set for +5 KHz and -5KHz. The meter will then show the offset from the center frequency. When you switch between Auto Tune and Manual Tune, you will have to setup the meter for both modes but I prefer to use the digital readout in Auto Tune. It's less confusing.

Auto tune shows the difference between the upper and lower limits and the offset is plus or minus the reference frequency. For example. You can set the High/Low meter limits for 144MHz and 148 MHz and when you check a 2 meter radio in auto tune mode, the meter will measure the difference of 146 MHz and the 2 meter transmit frequency. If the transmit frequency is set for 147 the meter will show bar from 146 to 147 MHz and the readout will be + 1MHz. The meter limits will be -2 MHz and + 2MHz. The "REF SET" in this case the should be set for 146 MHz

By the way, The Limits are set using "SHIFT" key then "INCR/SET" (METER). Then on the right side of the screen under "Meters:" select the "Hi End" or "Lo End" and enter the frequency in MHz. This works for both Auto and Manual Tune.

Topic: 935  Message: 935

Hi I am Gary Fiber K8IZ.

I am interested in getting a service monitor and have read some good things about these former cellular monitors that also have the ability for two way work.

Been looking at Amtronix and its a tough decision between the HP-8924C which they sell refurbished, the E8285A which is cheaper, looks to be tested but not refurbished and the HP 8935 E 6380A which a friend has , I have not seen it personally,and also comes with the RF Tools package.

I currently have a HP-8656B sig gen and a 100 MHz scope. I want to do some work with bandpass filters and possibly exercise my GROL from
time to time as I approch retirement. Contrary to what my profile says I will tuen 60 this year.

Not to start any wars Is there any reason one is better than the
others?

Is it easy to obtain the RF Tools software in the event I purchase a unit that does not have those?

How about the electro luminicent displays, are they holding up? Any replacements available short of using an analog computer monitor in
its place?

The appealing thing about the HP-8935A is it is somewhat portable.
Like many others dedication a couple of thousand dollars to an instrument is a chunk of funds, so purchase of a more portable unit is not likely for my purposes today.

Looked at N1BS You Tube video's. He did a great job on showing how to use his E8285A though it looks a little slow to tune through frequenies. Had to turn down the computer speaker volume during the
IC-2100 sinad test though :) When at Icom I had access and did ocassionally use an IFR 1200S monitor. I'll have to take a look at the
8920A videos in the files section have not had time yet to do so.

Here at work I have access to an old Motorola R-2001C but understand should the CRT go bad its a $1300.00 bill from Motorols for just
the CRT.

Also Hi to Jack from Wilco Electronics. I worked with him during my Icom America years often.

Gary K8IZ

I think I would go with the 8924C unless you need to have a signal generator that is calibrated below 15 MHz. .  The 8924C will go lower, but the power input and output falls off. Everything else is ok.  It comes standard with almost everything, especially if you get one with the 60 or 100 watt input. I bought one off ebay that did not have the higher power input and put in the 60 watt conversion. I think I had about $ 950 in it when I finished.  Some other units may not have all the options you want.  Some of the other units do not have the spectrum analizer  or high stability oscillator.
I do not have a good way to check the stability of the oscillator, but by tuning in WWV at 20 mhz, the counter is either showing a 0 on the last number or  a 9 or 1 sometimes.

The RF Tools can be downloaded from the files section here and put on a pcmcia card if you have a computer that will take the pcmcia cards.  I do not see where they are really that useful except the coax fault locator.  You can do the other functions manually, it just may be easier to use with the RF tools.

Main drawback is weight, but I doubt there is much differance in 10 pounds if you have to move them.

Look over the information for the 8920B instead of the 8924C dcumentation as how to use the unit.  The 8924 has lots of the cell phone stuff that you probably will never use.  The buttons of the two units may not say exectally the same thing, and may be in differant places, but will work the same.

Minicircuits makes some return loss bridges that can be found on ebay that are good enough for general testing.  A ZFDC-20-5 is one to look for.  About 1/3 or less than the prices of others.

Let almost anything go out on most of the test monitors and you are looking at a thousand plus unless you fix it yourself.  That 8924C cost about $ 49,000 new.

N1BS does have some good vidios on U-tube.
I do not recall the link to it, but someone put a vidio of about 1 GB on the test sets.  I think it is an 8920, but most of the things apply to any of the mentioned series.

The RF tools option 11807E opt 100, is just softwear that is loaded in from a pcmcia card on the units that do not have it built in.

If there is anything I can tell you about, I can meet you on the air.  Just retired so around much of the time.

Gary,

I think you are located in the Seattle area. If you are interested and would like to put your hands on an 8924C and play with it a bit, I live in Snoqualmie, WA. I would be happy to open the shop for you.

Best Regards,

Brian

I don't think I'd need anything that goes below 15 MHz unless I was working on a HF rig.The HP-8656B will do that in AM anyway and I intend on keeping that. I am mostly interested in two way radio checkout, some duplexor tuning and RF bandpass filter measurements. I have been looking at the New Rigol DSA815-TG spectrun analyzer but the 8924C all fixed up from Amtronix is close to the same price though larger in size. Had a local offer to allow me to have a look at his 8924C and I will likely take him up on that offer in a week or so we when we can work it out. And thanks to you Ralph for the offer of an on the air meeting. Might have to give that a go away since I run mostly mobile HF, might be fun.Oh and thanks for the explainiation of your monitor too. :)

Hi Gary, welcome to the group.

There are several files in the files section that I uploaded along with others that you will find to be very usefull. Feel free to post your questions to this group. There's always someone with enough expertise that can help you navigate through the menus.

I was worked with an 8920 for years and when I acquired an 8924, operating it was second nature. The technology in Ham Radio equipment has advanced so much, I recent purchased a brand new digital storage oscilloscope. The old Tektronix analog scope just didn't cut it. There's no way you can trouble shoot digital logic using a 2 channel scope. My Agilent DSOX3024 even has a 16 channel digital port where I can use it as a Logic Analyzer. Unfortunately, for what it cost, I could have purchased 5 or 6 8924's.

Hi Jack,

Been a loong time as I have not been to Dayton for a couple of years. I got rid of mt Tek 7623 storage scope and got a Rigol DS1102CA a couple of years ago. I can connect it to a computer via a USB port, control it or download wiat is it reading to a file Pretty nice and almost better than a scope camera on the Old 7000 series mainframe.
No logic analyzer yet though. You are right the rigs have certainly passed me by. Still am pretty good with the old stuff but the newer stuff, just don't have the daily experience I did when working the phones every day.

I'll be around and thanks.

> I was worked with an 8920 for years and when I acquired an 8924, operating it was second nature. The technology in Ham Radio equipment has advanced so much, I recent purchased a brand new digital storage oscilloscope. The old Tektronix analog scope just didn't cut it. There's no way you can trouble shoot digital logic using a 2 channel scope. My Agilent DSOX3024 even has a 16 channel digital port where I can use it as a Logic Analyzer. Unfortunately, for what it cost, I could have purchased 5 or 6 8924's.

# 942. Another video converter

Yahoo group: hp8924
Date: 2012-06-02 00:38:26 UTC
From: mojoehand
Topic: 942  Message: 942

I know that the GBS 8200 has been reported to work, using an addon sync separator. I thought I'd take a chance on a one-piece unit and got one of these for $20:

http://www.ebay.com/itm/TV-BNC-Composite-S-video-VGA-In-to-PC-VGA-LCD-Out-Converter-Adapter-Box-Black-/180782631245

I tried it on the 8920A at work and got nothing but a blue screen, which is what the converter shows with no video input.

My E8285A arrived today (another story), so I tried the video converter on it. This time I got video, but it is cut off on the left side and bottom, and shifted left/down a bit. This is pretty much the same result that the GBS 8200 gives when feeding the HP video into the component Y connector. Close, but no cigar.

Opening up the converter, I see the following ICs: a Hynix memory chip; a large chip, marked ARK8119DPF (I can't find any info online); a smaller chip marked ARK7113PF (also no info); an Atmel 920 uP; a 74HC86D (Quad 2-input exclusive-or); two 24 MHZ oscillators; miscellaneous discrete parts. Silkscreened on the board is "TV-TO-PC128".

I was hoping that I could find datasheets on the ARK chips, thinking that perhaps a minor part change would make the thing lock onto the HP video properly.

Oh well, it was a $20 experiment. I guess I'll make a sync separator for a GBS 8200 and find a box to put it in.

# 945. Flash card experiment

Yahoo group: hp8924
Date: 2012-06-02 00:57:06 UTC
From: mojoehand
Topic: 945  Message: 945

I have two linear flash cards that were pulled from Cisco routers. One is a 4 MB card, branded "Smart". The other is a 16 MB card, branded "Intel Series 2+".

The only computer I have with a PCMCIA slot is an old P3 laptop with Windows XP. XP could not find a driver for either card. Searching the net, I found some drivers.

XP Device Manager was now happy, but XP would not assign a drive letter to either card. If it had, I could have simply dropped files onto the cards and used their full capacity.

The Smart card would fail formatting. I understand that this is likely due to the laptop not providing +12 VDC to the PCMCIA slot.

The Intel card did format (the 2+ cards don't need 12V). However, without drive letter access, I had to use Memory Card Explorer to write the RF Tools image. I wasn't sure if this would work, as everyone here has been using SRAM cards for this. I don't yet have an SRAM card, so I thought I'd try the flash card for the heck of it.

Putting the 16 MB Intel flash card into the E8285A, it is recognized as a 512 KB ROM card. This was to be expected, since I wrote that type of image to the card.

So, until I get an SRAM card, at least I can run the RF Tools from this flash card.

I am still trying to see if there is a way to make XP assign a drive letter to these cards.

# 946. A27 Reference

Yahoo group: hp8924
Date: 2012-06-02 01:39:54 UTC
From: c_day_nz
Topic: 946  Message: 946

The A27 reference module fitted to my 8924C is 08920-61191. Rummaging through my parts I found a high stability reference module from a stripped down E8285 08920-61192 so have fitted this to my 8924C. I run LISTOPS from ROM but it does not show the option installed. I gather I need to load calibration data into the test set which I don't have. Can anyone tell me how I can go about doing this? I'm rather intrigued on how the whole option system works i.e. what needs to be done to tell the analyser and option has been installed & if there is a standard format for updating the alayser for various option ☐ or is each option unique. Finally, does anyone know where I can find a list of all available options ☐ option number, board / module number, etc.

Cheers,

Chris ZL1CVD

# 947. A17 External Memory

Yahoo group: hp8924
Date: 2012-06-02 02:09:06 UTC
From: c_day_nz
Topic: 947  Message: 947

The A17 External Memory board 08924-60194 has a bunch of empty sockets on it. I'm picking this is for a RAM upgrade option. Can anyone confirm this and or advise part number for suitable IC's.

Also, this module has the PCMCIA slot on it. I recently received a PROM card with RF Tools on it. However the analyser doesn't recognise the card (error 85 when trying to access it TESTS or IBASIC). Has anyone experienced any issues with the PCMCIA interface on A17 ☐ have checked for dry joints, broken pins & cleaned contacts. Am awaiting a SDRAM card to confirm operation but thought I'd ask in the mean time.

Cheers,

Chris ZL1CVD

I heard back from Amtronix. Rick tells me that I have a "converted" unit and that it was flashed with older firmware (to support below 800 MHz), after having newer firmware. I don't know what else (if anything) gets done during the conversion. He tells me that these converted units will fail several of the self tests on the RF menu, but the unit is OK.

I wish I had known these details beforehand. It's disconcerting to get something shipped to me and first thing, it is failing self test.

It's a shame that these tests fail, as HP put such nice self test features in many pieces of equipment. Having them is a great way to have confidence in your test gear.

Just a bit more on the empty sockets - 8x 32-PLCC - U12 to U19. The only types of memory type I can find in this package are EPROM, EEPROM & FLASH. I suspect they are for an EPROM or EEPROM option. I wonder if I installed FLASH chips the analyser would see the memory and allow me to read/write to it. As an aside the board also has CXK581000BM-10LL 131072x8 SDRAM, RTC72423 RTC, PCMCIA socket & Panasonic BR-2/3 3V battery. Don't suppose anyone has the circuit?

So far, I have only done some preliminary fooling around with it. I had to clear off my work table, which has been buried for months. This grew into a major cleanup and reorganization project. My table is now clear and the E8285A is on a small metal shelf next to the table. I'm going to finish with the cleanup of the rest of my "junk" and hopefully I'll be working a radio by the weekend.

Joe,

Did Amtronix tell you what serial numbers were best for the E8285A..There is one seller on Ebay who is near me in Bellevue, WA that has 8 of them, wants $1595.00 for one,several have OPT 102. Photo looks like they are pretty clean. But they don't know if the RF generator will generate below 800 MHz.
I am not sure if they all with do that or not.

I sent Amtronix a 2nd email a yesterday but he has not responded. His web page and pricing is a bit confusing. I did ask a week ago about an E8285A and he told me the E8285A sold for $9500.00 I think due to his web page he ment to say $950.00 but I asked him to clarify and how he accepted payment. Also spotted a few E6380A and HP8924C's

it was flashed with older firmware (to support below 800 MHz), after having newer firmware. I don't know what else (if anything) gets done during the conversion. He tells me that these converted units will fail several of the self tests on the RF menu, but the unit is OK.

# 959. Re: E8285A arrived today

Yahoo group: hp8924
Date: 2012-06-09 04:09:07 UTC
From: mojoehand
Topic: 943  Message: 959

I thought that it had to be A.02.04 or earlier. Mine came with A.02.04 firmware.

The following is direct from the "Assembly Level Repair" manual:

Firmware Version: A.01.29 to A.02.04 (100-1000, 1700-2000 MHz)
Firmware Version: A.04.53 and above (800-1000, 1700-2000 MHz)

# 961. E8285 and E6380 questions

Yahoo group: hp8924
Date: 2012-06-09 04:37:49 UTC
From: Tim
Topic: 961  Message: 961

Hi all,

A question for anyone familiar with either the E8285 or E6380...

Can either of them be extended to cover 1296Mhz or will either of them
work at that frequency but with reduced sensitivity or output ?

thanks

Tim

# 962. HP-8935A / E6380A

Yahoo group: hp8924
Date: 2012-06-09 21:11:46 UTC
From: Gary
Topic: 962  Message: 962

I ended up taking the plunge and purchased a HP-8935A / E6380A. Its slightly more portable than the 8924C or E8285A. It should be here by next weekend if UPS is kind. It was built in 2001 according to the serial number.

I tried to get in touch with Amtronix but he did not answer my 2nd email nor phone call. I suspect he may have been away from his business.
I think he has parts for the E6380A should I need them in the future so I will likely try to do business with him in the future. Now to find a Return Loss bridge so the RF tools work like they should.

Building a Oak Hill research QRP wattmeter today. Looking forward to receiving my new to me test set.

I just tried this on my E8285A. I can enter the following frequency ranges: 0.000001-1015 MHz, 1700-2000 MHz. Entering any other frequency produces an "Input value out of range" error.

I believe that the firmware locks out the intermediate frequency range.

Does anyone have a copy of the A.02.04 firmware for the E8285A? It might be worth a look to see if it can be patched to defeat the lockout on the 1000-1700 MHz frequency range.

# 965. Video success

Yahoo group: hp8924
Date: 2012-06-10 17:46:46 UTC
From: mojoehand
Topic: 965  Message: 965

Using a GBS 8200, as others have, I added a LM1881 sync separator chip. Plugging everything into my newly acquired E8285A, I had video on a 19" LCD monitor. However, it was shifted left and cutoff.

Using the menu selections on the GBS 8200, I adjusted the vertical/horizontal position and width to get the full image on the LCD.

Next was the previously mentioned black level problem. However, I did not have to add resistors to the GBS 8200 to fix this. I lowered the "Clamp st" value several points and the "Clamp sp" value one point to get an acceptably black background on the LCD.

As expected, the upscaling of the image to SVGA resolutions is not perfect. The characters are a bit jagged. Still, things are perfectly readable and this is a worthwhile video upgrade.

Now that I can display the E8285A screen on an LCD, I may open up the unit and disconnect the internal electroluminescent display to prevent further burn in (I'll probably wait until my Amtronix warranty is up, though).

If you want a return loss bridge, look for a Mini-circuits ZFDC-20-5.

It is about 1/3 the cost of the others and works well enough for general testing.

Thanks for the tip Ralph. I will look at the Mini-Circuits ZFDC-20-5
Only need something to get started with and it does not need to be high power capable especially for receiver filters, cirsuits etc.
Its does not have the high stability oscillator. If I need something like that, I will look for a GPS locked timebase.

# 975. Re: [hp8924] Re: HP-8935A / E6380A

Yahoo group: hp8924
Date: 2012-06-11 18:53:36 UTC
From: Ralph Mowery
Topic: 962  Message: 975

I am not sure how the 8935 is labled as I have the 8924.  However the minicircuits unit will hook up so that the port labled  OUT will go to the output of the 8935 (labled Dupled on the 8924), the Port labled CPL will go to the antenna input, and the port labled IN goes out to the device under test such as a duplexer.

Here is what I got off the internet.

Using the 8924 with a Mini-Circuits ZFDC-20-5 to measure return loss.
The first thing to do is to configure the 8924 for "duplex out" and
"antenna in"and set up the tracking generator for no offset. To measure
return loss hook the "duplex out" on the generator to the "out" connection
of the directional coupler. Then hook the "antenna in" port to "couple" of
the directional coupler. You can now establish the base line on the spectrum
analyzer as this will show infinite SWR or minimum return loss. It should
read about 20 db less than what you are generating. Once you've done this
connect the load or device under test to the "in" port of the coupler. The
space under the base line on the spectrum analyzer is the return loss in
negative db. (Note: this may be counter intuitive to some but we're using
the directional coupler to measure what's coming back as apposed to what's
going out which is what the labels on it are for.)

Chris,

Thank you for sharing your excellent documentation! I just took a look and I may have to go down this road. I'm currently using an additional outboard attenuation which works fine but is a bit cumbersome.

The question I have is did HP/Agilent change the design of the heatsink assembly based on the maximum input power? I assume that there is a thermal sensor on the assembly to alert the user of an over temp situation. Perhaps we just have to live with the reduced duty cycle at high power? An advantage of my outboard attenuator is that I can put a fan on it for long duration durability testing of repeater PA's.

Before I ordered an upgrade off ebay, I asked a similar question to the seller.  I was told the 60 watt upgrade uses the same heatsink as the 3 watt unit.  I think, but not sure about the 100 watt unit uses a differant heatsink.

Anyway, after installing the new attenuator pad on the old heatsink that takes it from 3 watts to 60 watts and the new softwear, my 8924C takes power up to 60 watts for a while and does not alarm.  I have put it to around 100 watts a couple of times and in a very short time( maybe 10 seconds) the over power alarm sounds off.

assume that there is a thermal sensor on the assembly to
alert the user of an over temp situation. Perhaps we just
have to live with the reduced duty cycle at high power? An
advantage of my outboard attenuator is that I can put a fan
on it for long duration durability testing of repeater PA's.

Hi,
All the 892x units I've seen have the same heatsink. I think the shutdown Ralph has seen is calculated, i.e. the unit measures over 60W so alarms on the measured power level not the temperature. This allows protection without delay. The heatsink does not have a temperature sensor attached to it. I don't know if there is a general overheat sensor in the 8924 but suspect there is somewere.

Robert G8RPI.

Subject: Re: [hp8924] Re: Modifying internal 3W attenuator (Assembly A4)

Before I ordered an upgrade off ebay, I asked a similar question to the seller.  I was told the 60 watt upgrade uses the same heatsink as the 3 watt unit.  I think, but not sure about the 100 watt unit uses a differant heatsink.

Anyway, after installing the new attenuator pad on the old heatsink that takes it from 3 watts to 60 watts and the new softwear, my 8924C takes power up to 60 watts for a while and does not alarm.  I have put it to around 100 watts a couple of times and in a very short time( maybe 10 seconds) the over power alarm sounds off.

I do not know where the temperature sensor is except it is not on the heat sink where the power attenuator is.  From this I guess that the sensor puts out  a voltage and as you change the attenuator, the eeprom calibration number changes.

Here is what the service manual says about the power detection:

RF Power Measurement
The A5 Input assembly's power splitter has one port terminated by a 50Ω load with a diode peak detector across it and a temperature sensor near it. The output of the diode detector is sent to the A37 Measurement assembly where it is measured. The A16 Host Controller converts the measured value to RF power and displays it.
A temperature sensor detects the presence of too much power at the RF IN/OUT connector. The output of the sensor is a DC voltage proportional to RF power. This voltage is measured by the A37 Measurement assembly, and the value is compared to a reference limit by the A16 Host Controller. The Controller displays an overpower message if the voltage goes above the limit. The temperature sensor is also used to temperature-compensate the RF power measurement.
Accuracy is ensured using factory-generated calibration data stored in EEPROM. Unlike the level-control calibration data for the RF Generator, the calibration data is mathematically applied to the measurement results by the A16 Host Controller. The following assemblies have calibration data which affects RF power measurement:
• A4 Attenuator
• A5 Input
• A37 Measurement

I finally did find the over power temperature sensor.  Really a block diagram and it shows it on a circuit board .  Looks like the input goes through the high power attenuator, then a low power attenuator/spliter and to a resistor.  The heat of that resistor is measured. Must be a very  sensitive heat sensor by the time the power gets to that point.

Hi Ralph,
Interesting. Sounds almost like they have a thermistor type power head on the board. I wonder if they use it in conjunction with the diode sensor to calculate the power. As its after two attenuators is is effectivly a power sensor rather than a over temperature of the attenuator. Cause or effect.
Nice work on the circuit tracing.

Robert G8RPI.

Guys, thanks for the good discussion on this.

I have used a couple of monitors in the past and I was pretty sure that they had sensors on the heatsink. Of course I managed to get them to light up...

I'm going to order one of the 20db pads and go from there. Even if it only gets me to a short term 60w input that allows a lot more range without mucking about with the external pad. I may have a 250w 6db external attenuator somewhere too.

When I get in there I will take a close look at the heatsink assembly. I manage a machine shop so perhaps I can make a modified attenuator mount or a copper spreader to attempt to improve things thermally.

Speaking of machining and the 8624, my unit has a badly cracked rear panel foot. I was considering making some new feet for mine machined from solid Delrin, I wonder if anyone else could use replacement feet for their units?

Hi guys,

Well its interesting to get a few requests for feet, I wondered if breakage might not be common. I purchased my 8924 with a broken foot but they seem fragile and age may not be helping in this regard. Of course, in their defense, HP never really designed these beasties to be portable...

I haven't thought of pricing yet, there are a number of variables, most of which are how many sets we'd run. I'd like to offer them to the community at "hobbiest" pricing so I would do what I could in this regard. My goal is to only pay the cost of the material an operating costs of the shop. The design I have in mind would be that they be fully CNC machined from solid blocks of either Delrin or possibly Nylon. These would NEVER break, I'd probably offer a lifetime breakage warranty!. The downside is that I would guess they may be ~$80 a set, let me work some numbers and price out the material.

I wonder if there are any other HP/Agilent instruments that use the same feet that might have owners interested in replacements also. The more that could be run the more the setup and one-time costs can be amortized across all the parts reducing the pricing.

# 989. Power on/off switch not working

Yahoo group: hp8924
Date: 2012-06-21 00:20:33 UTC
From: zigs68
Topic: 989  Message: 989

Hi - I have read posts about intermittent power up issues but this one is perhaps different. I plug in the 8924 I have and with the power button off (fully out) the unit powers up. And you are not able to power down the unit using the power button other than by disconnecting the ac line cord. Its like the power button is not connected somehow. No errors, etc were noticed when the unit was running with this issue and the functions I tried seem to all work fine.

Does anybody have any ideas on what happened? Dod the power switch just go bad or does this indicate more of a problem? The unit was sitting on the bench and has not been moved for months (no rough handling). I have the unit now on a power strip by itself so if all I have to do is switch ac power from the strip to power up and down that is not the worst thing.

From: Robert Atkinson
Topic: 991  Message: 992

Hi Bob,
You use the audio input BNC on the right hand side of the front panel. Then access the AF analyser and / or oscilloscope screens through the menus. Don't forget to select the external AF input, the default is the output of the receiver (TX Test)

As has been mentioned before, reading the 8920B (or 8920A) manual and guides (see files section or Agilent website) gives a better idea of how to use the 8924C for non CDMA appplications. The 8924C manual is CDMA centric, but the unit is basically an 8920B.

Robert G8RPI.

What you are describing is identical to how mine is currently behaving. It was fine when I first got it, but this issue started showing up after I had pulled the covers off and reseated a few boards to fix another problem. I also did a thorough cleaning and dusting on the inside at the time to improve airflow. I think maybe in the process of doing the above, I must have jostled something else loose.

Mine is rack mounted and it's a pain to pull it out again, but eventually I will. When I do, I plan on using a small shot of DeoxIT on any board and connector contacts in the PS area and see if it's related to something there. (Didn't use DeoxIT this first time I had it apart and I kick myself for not doing that.) I normally use the rack's master power switch anyway, so that's why I haven't been motivated to try and fix this bug yet.

Ok Mike - the concern was that is behavior was a warning of something going bad in time with the unit.  I do not have Deoxit to work on this but if you have been working ok with using your rack power switch then that is some helpful info.

I have not opened up this unit to clean or dust out - just one day the issue happened.

Thanks for the reply - Sig....

Hi Gary,
Don't know about Amtronix, but do about external references.
The 8924C has a very good ovenised (OCXO) reference as standard. The E6380A has a resonable TCXO as standard and a good (not as good as the 8924C's) optional OCXO. If you need the extra stability a GPS disciplined OCXO is the way to go. You can make your own, but if that is your interest and you just want a stable reference, buy a used Trimble Thunderbolt. These are available from China on ebay (http://myworld.ebay.co.uk/fluke.l/ is a known good source). The 8924C does not need one for most applications. Beware precision time and frequency is catching, try time nuts on yahoo groups.

Robert,

I guess Amtronix could be on vacation, just seems a little odd not getting some sort of reply. I'll try again later.

I'll look at the Trimble Thunderbolt, have an HP-8656B Sig Gen too and it would be nice to attach them to a common reference I think. Truth be known both are probably as accurate as I require currently.

Thanks for the advice and I will try to not go nuts with frequency and time accuracy ;) hahaha

Gary,
My last email correspondence with Rick was on 6/16 and he replied on 6/17. The email address I used is the first of the two you listed (assuming the last half of it, which I can't see -THANKS YAHOO!- , is correct. Sorry to hear he missed out on the sale! Very pleased with all my dealings with Amtronix.

Yes amtronix.com was the last. Maybe I'll try again using yahoo or gmail as the email client. Its possible my comcast email is not making it I guess. Thanks for the update, everyone says he is good to deal with.

Hello,

I am sorry for reaching you rather too late due to the situation of things right now. My family and I had a trip visiting (MADRID SPAIN), Everything was going on fine until last night when we got attacked by some unknown gunmen. All our money,phones and credit cards was stolen away including some valuable items, It was a terrible experience but the good thing is they didn't hurt anyone or made away with our passports.

We have reported the incident to the local authorities and the consulate but their response was too casual, we were ask to come back in 2weeks time for investigations to be made proper, but the truth is we can't wait till then as we have just got our return flight booked and is leaving in few hours from now but presently having problems sorting out our bills here an and also getting a cab down to the airport, Right now we're financially strapped due to the unexpected robbery attack, Wondering if you can help us with a quick loan to sort our bills and get back home. All we need is (€1,850.00 EUR),  I promise to refund you in full as soon as I return hopefully tomorrow or next. write back now to let me know what you can do.

Thank You,

Edwin.

Does the power button on your 8924 snap in and snap out? I occasionally have a similar problem. In the ON position I push in the button and hold it in with my thumb. Then I slide my thumb off to the side and let the button snap out. This normally fixes the problem. With mine, it's a mechanical problem with the switch.

I have recieved several of these type messages over the past 5 years. General type reply is shown below.

Yes we can help on this end. Know government is slow and not quick. Please send in address to send payment. It will take one or two days to arrange payment.

In late 2010 we caught a guy in Spain when he sent address of Western Union shop to wire money.

Hi, the switch mechanically does seem to be fine where it snaps on and off, etc. What I did notice is that after use of say 45 minutes to an hour of it being on then the unit can be turned off and then on with the switch. You leave it off for a day with the ac disconnected on the power strip and then when you power up the strip the unit powers up regardless of if the power button is on or off. No other ill effects have been seen yet so I am not sure what gives. Even if the switch seems to be snapping in and out it could still be a mechanical issue perhaps. Thanks for the tip though.

# 1007. Re: [hp8924] Re: Power on/off switch not working

From: Glenn Little WB4UIV
Topic: 989  Message: 1007

The service information that I have for the 8924 does not address what is inside the power supply.
The power supply is probably a switch mode power supply.
That said, all switch mode power supplies have a problem with capacitors.
When the ESR goes up on a capacitor used in filter service the heat dissipated in the capacitor goes up.
This causes the electrolyte to dry out.
This causes the ESR to go up.
This continues until the capacitor fails.
In the process of failing, one of the symptoms that is observed is what you describe.

I suspect that you need to change the electrolytics in your power supply.
Ensure that you use the correct capacitors for the application.

Change the capacitors and your 8924 should work as new.

# 1009. E8285A Firmware

Yahoo group: hp8924
Date: 2012-07-06 11:53:37 UTC
From: c_day_nz
Topic: 1009  Message: 1009

Does anyone know where I can get older firmware for the E8285A that will allow operation at frequencies down to 40MHz or less? I believe this is firmware revisions earlier than A.04.5X. I understand the calibration issues. Also, does anyone know how to back up existing firmware? Cheers & 73s, Chris. ZL1CVD.

Russ,

I feel your pain (mostly in my lower back!). These instruments are big and unwieldy for sure, I cringe at the idea of transporting mine to our repeater site but I do it from time to time.

I pulled my unbroken foot off of my unit and brought it into the shop. We have been pretty busy lately so "government" jobs don't get top billing. I will try to generate a 3d model of the foot and figure out what these will cost. Its good to see a bit of interest in them as the more sets I make the more we can share in setup and programming costs. I'll post again when I have a better handle on it!

# 1012. Spectrum analyzer sweep rate?

Yahoo group: hp8924
Date: 2012-07-16 07:47:04 UTC
From: jistabout
Topic: 1012  Message: 1012

Hi everyone!

Is there a way to vary the sweep rate on the 8924c spectrum analyzer so as to achieve a bit quicker refresh? Signals which come and go quickly are sometimes not seen, at least on my unit. Thoughts appreciated :).

- Darrell/ka7btv

# 1013. Re: [hp8924] Spectrum analyzer sweep rate?

Yahoo group: hp8924
Date: 2012-07-16 08:06:35 UTC
From: Colin Matten
Topic: 1012  Message: 1013

Hi,

On my 8921a you can't set the sweep or RBW. It is based on the span.

I found the following a a manual.

Span RBW(KHz) Sweep Rate
<50 kHz 0.3 28.6 kHz/second
<200 kHz 1.0 329.0 kHz/second
<1.5 MHz 3.0 3.0 MHz/second
<3 MHz 30.0 21.4 MHz/second
<18 MHz 30.0 36.3 MHz/second
<200 MHz 300.0 257.0 MHz/second
1 GHz 300.0 1.0 GHz/second

Regards

Colin

The spectrum analyzer has a setting called pk/hold (peak hold) which will capture fleeting signals and freeze them on the display.

# 1015. Video converter adapter for 8924C

Yahoo group: hp8924
Date: 2012-07-20 02:41:40 UTC
From: Don
Topic: 1015  Message: 1015

Hi all,

New member here and this is my first post...

I have read with considerable interest the various threads on using an external VGA monitor with the 8924C. Some have successfully used a GBS 8200 card which according to some posts I have read requires a sync separator to be built. Has anyone tried one of these composite video-to-VGA adapters that are plentiful on the bay? Here's a link of one of them. It has a composite video in, S-video in and VGA out. Any reason why it wouldn't work with the 8924c?

Well.. it appears I cannot get the ebay link to show up properly. Here's the item # 270993690088

# 1016. Re: [hp8924] Video converter adapter for 8924C

Yahoo group: hp8924

From: Robert Atkinson
Topic: 1015  Message: 1016

Hi Don,
I don't think this will work. It's only intended for standard 525 line video. There is quite a lot more to the GBS8200, it's intended for applications that used non-standard high resolution CRT monitors like arcade video games and early CNC machines. Adding the sync separator to the GBS8200 is pretty easy. You can buy packaged versions with the sync seperator built in but these are a lot more expensive. try the archive for more info on what ones work.

Hi Rix,
There is a circuit (not mine) in the files section < http://f1.grp.yahoofs.com/v1/0MYJUKzMiBC0cZDSkKRjPpqXRDMX0KM4N0p28XQ13mLfQSUdTG6Wm9QSyYh_3893Gk1TdPi-V8TPG9RKUNGq50N_qYqPdssWTA/SyncSeparator.pdf >
I used the LM1881 dedicated chip, slight overkill but I had one, it works and there is no adjustments required. see http://www.ti.com/product/lm1881 Just use the default circuit on page 1 of the datasheet.

HTH,
Robert G8RPI.

Thanks for the info, Robert. Too bad it will not work. It would have been a cheap and simple solution if it did.

Don

From: willcoele@ameritech.net
Topic: 1015  Message: 1022

Hi Don,

I uploaded a few photos, in the photo section, showing modifications that I did to the GBS8200. Because of the non-standard (19.2KHz) scan rate, tge GBS8200 has a problem establishing an AGC level. AGC is derived from the equalization pulses during the verticle sync interval. The 19.2 rate deviates form any standard rate and causes composite DC level to drift. I was able to overcome this by adding bias resistors to the RGB inputs. Without the resistors the green (if that's the input you connected) will fade, over time, into a green rastor.

@willcoele

I did see the photos you have posted.. very impressive work, but I am not sure I will be able to reproduce your work (have never worked with surface mount components). How DO you work with such tiny components? This was the reason I was looking for a plug-and-play solution.

Don, I bought an MVC007 from Moncotech early this year on ebay it was $150.

It works great and is "plug and play". All I had to do was go into the set up menu and set the vertical and horizontal size and position on the screen.

I have it on a 15 inch VGA monitor and it works great. Just for the hell of it I put it on a Power Point Projector and it did an image about 4 ft square on the white shop wall.

The guy advertised them for around $190 but later discounted them.

My hands are a little too shaky for the SMD stuff and it would have to be mounted in a box etc. I bought one of ebay and later sold it after I looked at the project. Technically it wasn't too tough but the miniature work was an issue.

Hi Tony,

Took a look at the MVC007 on the bay. The listing states that some soldering may be needed and also that an oscilloscope may be needed. Did you have to do any soldering or use a scope to get yours working?
Also, how is the unit connected to the 8924C? Do you just connect a BNC cable between the video output connector on the 8924c and the "green" BNC connector on the MVC007?

Don, did nothing. Just used 50 ohm cable [later changed to 75 ohm] connected via BNC to 8924 and then to MVC007. Used VGA from MVC to monitor. It comes out in green.

When it first came up it didn't fill screen but was still larger than 8924. I used MVC007 menu to make it larger and position it so it is full screen and centered. Used it now for several months and it is working fine. I don't sue it all the time and I unplug it from power supply when not in use. It keeps settings so no issue.

I also have laser printer hooked up to 8924. I had a Deskjet 540 but if I didn't use it often the ink would dry out so switched to Laserjet 4 Plus.

Don I am on th G/Y connector which is second from right side.

I tried several monitors and all sorked great, but presently am using a 13" VGA that I bought at local hamfest for $15. It is plenty big but not overpowering and sits on top of 8924.

# 1029. RF in/out Vs. antenna in

Yahoo group: hp8924
Date: 2012-07-27 14:05:19 UTC
From: Don
Topic: 1029  Message: 1029

I am awaiting delivery of my recently purchased 8924C. In the meantime I have been reading up on the instrument and have a question re: the input ports.

I see that the antenna-in port is rated for a 200 mW input. How does that translate in terms of the transmitter power when checking a transmitter? For instance, I have a Motorola HT90 which is a 4W UHF two-way radio. Can I key it up near the 8924C (with an antenna connected to the antenna-in port) for off-the air measurements? In other words, will the antenna-in port see 4W or is it a much lower number? Sorry if this is a dumb question. If doing that is not advisable, could I connect an antenna to the RF in/out port for the measurements? I do not have an N-to-BNC adapter yet, so a direct connection between the 8924C and the radio is not possible, and I don't want to do a direct connection between the radio and the antenna-in port for obvious reasons.

# 1030. Re: RF in/out Vs. antenna in

Yahoo group: hp8924

From: jistabout
Topic: 1029  Message: 1030

Hi Don, not a dumb question at all.

The antenna port on the 8924c is for just that: an antenna. This port is used for off-air monitoring and measurements. NEVER connect a transmitter directly to the antenna port!

You can indeed use the antenna port for testing of nearby transmitters. Attach a small antenna to the antenna port, and the 8924c will receive signals off-air just like any other receiver. As long as your transmitting antenna is more than about 1 foot from the 8924c, it should work fine.

If you are not measuring transmitter power and just want to evaluate the signal, antenna port works fine. If you need to measure transmitter power, use the RF In/Out port.

You CAN connect a QRP transmitter of 200 milliwatts or less directly to the antenna port for power measurement, I doubt that many folks do this.

Anyway, hope this helps!

Chris and Group,
I just got one of these attenuators
http://www.ebay.com/itm/Attenuator-RF-FLORIDA-100W-20db-1A-TESTED-WORKING-/190697013394?pt=LH_DefaultDomain_0&hash=item2c666d8092

Once I get a chance I'll pop the top cover & see if I can fit it in the old attenuators place on the heat sink.

I think you will need at least a 30db attenuator. I'm sure the 3 watt 8924 has a 10 db attenuator. The RF I/O module (A23) has a max rating of 31db or 1.245 watts. With a 10 DB attenuator the level, it will be annenuated to .1245 watts or 21.3dbm . That's enough head room to get 3 watts max input or 24.9 dbm.

With another 10 db of attenuation you will can increase the power by 10 or 12.45 watts. If your goal is to get to 100 watts you will need 30 db of attenaution or 100 times the max (safe) level of 124.5 watts.

at 100 watts your 20db attenuator will attenuate the level to 30 dbm. That's pushing it and it will probably trip the high power alarm.

Gang
Although considerably pricier there are attenuators on ebay that come with a pcmcia card with the calibration data you need. I have a 60 watt att and have no problem with low power handhelds.
With an external attenuator you can calibrate the unit to take it into account to give you true power readings.
good luck

The service manual I have shows the 3 watt unit to have a 4 db attenuator.

I measured the ohm value of the 3 watt unit I took out of my8924C and across the input and output the resistance is about 22.5 ohms and from each side to ground is about 114 ohms.

Looking at a chart for the PI type, this seems to be close to the 4 db value.

The standard 3W 8924 has a 4dB attenuator fitted in side the A4 assembly. A 20dB attenuator fitted works & doesn't trip the high power alarm at 100W. Some may view fitting a 30dB attenuator a safer option but sensistivity and RF generator levels on the port will be 10dB lower. The other consideration is heat. I doubt the A4 assembly heatsink will effectively dissapate 100W for long periods - 60W max for long periods -100W for short periods should be fine.

This is more to prevent heat build up inside the 8924 as its SMPSU dissapates a heck of allot of heat - you will see one of the top inside covers shows a warning about not running it with the covers removed - has a picture of a bomb from memory. I can tell you that if you do run it with no fan connected, the SMPSU gets hot enough to burn your hand after about 10 minutes. I suspect 20 minutes will result in complete failure of the SMPSU. Intersting to note the later model E8285 test set actualy monitors fan speed - if the fans aren't running it won't power up. I suspect this is a later mod.

Cheers & 73s Chris ZL1CVD

That should do the job fine bill. May need to mill out the A4 opening a bit more or trim the tabs down like I did (very ugly but it worked). 73s Chris.

Before I ordered a 60 watt upgrade from RFE TOYS I asked about it.  I was told the same heatsink was used on all the units form 3 watts up to 60 watts and the resistor pad was all that was differant.  The 100 watt unit would need a differant kind of heatsink.

I guess that if the resistor pad ( or one of the ones similar to it listed on ebay) for 100 watts would fit, it could be used, but still the heatsink will only be good for 60 watts and any more than that would still overheat after a while.  The 60 watt unit will take around 100 watts for about 10 seconds or so with a cool down period.  Looking over the diagram of the input circuit, the over power warning seems to come from an input module and not the heatsink so you could over heat that and not get the warning if a higher power/more db loss attenuator was used.

First I would like to apologies for the wrong information. The service manual that I have only shows the part number no parts specs. A 4 db attenuator would bring it within the 31dbm range.

I prefer using an external 20db attenuator. it very safe and I dont have to worry about over heating the unit. As for the genetator level, you can always use the duplex port. it bypases the attenuator.

# 1040. CRT image size question

Yahoo group: hp8924
Date: 2012-07-30 22:55:43 UTC
From: Don
Topic: 1040  Message: 1040

Hi all,

Just received my 8924C. Thankfully, it survived UPS handling! A very quick cursory check indicates that the unit powers up and at least the spectrum analyzer part appears to be functioning properly. However, I have noted two immediate issues that I am hoping will have easy fixes:

1. The CRT image is horizontally compressed (image does not extend to the edges but is horizontally squished although centered.

2. When I press the power on-off button to turn the unit off, it powers down, but then immediately powers back up again. So, the only way I can turn power off is to pull the plug on the unit.

Any ideas on how I can rectify these problems?

# 1041. Re: CRT image size question

On playing with it further, I have found that it has more problems :(
When I turn it on, there is nothing on the screen for perhaps 7-9 out of 10 times that I power it up. On the remaining tries, the screen comes on and the brightness varies from very dim, barely visible, to fairly bright and clear (with the brightness level set on max in configuration). Again, I am unable to turn the unit off using the power button on the front panel. It shuts down but restarts again almost immediately (after about a second). Does this sound like a power supply problem? Once it powers on properly, it seems to work OK. I ran through the verification tests and everything looks OK. Any help will be greatly appreciated.

Hi Don. Sounds like power supply related issues to me. Sounds like the +15V STBY rail is dropping in and out - possibly a dry cap. There is some very good information on the 8924 power supply in the group files section. Replace the common faulty caps and I think you'll find your problems go away. Cheers, Chris.

I should clarify that on those tries when nothing comes up on the CRT, the 8924C does power up (or at least used to...it doesn't now) and appears to go through the boot-up routine (the fan comes on, I hear the beep and some crackling in the speaker).

It appears that it IS a power supply problem. The unit now does not turn on at all. Looks like the PSU has given up it's ghost. I have a replacement unit on its way. Hopefully it will not have any issues.

Mine does that as well. To me it smells like an overheated component, probably a resistor. It doesn't do it all the time, very unpredictable and random, and the odor seems to go away fairly quickly if it's left on. It happened frequently when I first got the unit but, as time goes on, it seems to happen less often. Still, it's a bit disconcerting.

I tore my HP8920A apart trying to find the source, and could not.

When I asked about it a few years back, others mentioned it may be the AC Mains filter. But I noticed the smell is still there, even if I use the DC input, so I don't think my issue was the filter. Has anyone else tried the DC input to isolate part of the circuit?

It may be that the smell is noticed at turn on is not electronic. The smell may be because the fan is blowing out a smell that has accumulated while the unit is off.
The epoxy cased self healing EMI capacitors are infamous for givving off bad smells. Of course they do not stop the unit from operating if they fail (unless they go completely short circuit, but you will notice that. This is a common problen on Solartron 7150 DMMs and Farnell G series power supplies.

I have an 8924 and a 8920 and I think I have notice something similar. Sort of wax smell. I haven't studied the circuit but if they had a YIG filter then they get quite hot in use. As the units only go up to 1Ghz I suspect they won't have one though. It could be foam packing and the fan evacuating the built up smells in the case until its all gone and until its left idle again for a while.

Subject: Re: [hp8924] Re: HP 8920B odd smell on power up.

It may be that the smell is noticed at turn on is not electronic. The smell may be because the fan is blowing out a smell that has accumulated while the unit is off.
The epoxy cased self healing EMI capacitors are infamous for givving off bad smells. Of course they do not stop the unit from operating if they fail (unless they go completely short circuit, but you will notice that. This is a common problen on Solartron 7150 DMMs and Farnell G series power supplies.

Subject: Re: [hp8924] Re: HP 8920B odd smell on power up.

I tore my HP8920A apart trying to find the source, and could not.

When I asked about it a few years back, others mentioned it may be the AC Mains filter. But I noticed the smell is still there, even if I use the DC input, so I don't think my issue was the filter. Has anyone else tried the DC input to isolate part of the circuit?

Tom/all,

Mine does the same thing... I keep waiting for a wisp of smoke to come out of the box & then everything goes dark!

It does smell like a resistor cooking.

Tim

Mine does that as well. To me it smells like an overheated component, probably a resistor. It doesn't do it all the time, very unpredictable and random, and the odor seems to go away fairly quickly if it's left on. It happened frequently when I first got the unit but, as time goes on, it seems to happen less often. Still, it's a bit disconcerting.
Tom

# 1053. Disabling or disconnecting CRT?

Yahoo group: hp8924
Date: 2012-08-06 11:58:36 UTC
From: Don
Topic: 1053  Message: 1053

This is for those of you that are using external monitors with your 8924Cs...

Is there a way to turn-off the CRT when using an external monitor (to prevent screen burn-in)? I am still finding my way around with my newly acquired 8924C and I am considering the external monitor option. I know on some HP equipment (like my 8568B Spectrum Analyzer) the CRT can be turned off by a combination of keystrokes from the front panel. Is there a similar keystroke-combination for the 8924C? I guess one option on the 8924C would be to set the screen intensity at it's lowest setting in configuration menu.

Would internally disconnecting the cable to the CRT lead to any deleterious effects on the high-voltage part of the power supply?

Chris, I just got through with putting that attenuator in an 8924, The heat sink has screw holes that do not align perfectly with the new attenuator. I cheated and put the new one on top of the old one after altering the holes. I just ground down the solder tabs on the old one and used it as the holder for the new one. A little playing around and I managed to bet both screws aligned. Dremel tool came in handy. I just gave the configure a -16 dB offset and it tracks pretty will with my bird 43. Good luck. I am interested in the TFT monitor conversion. Sounds awesome!!

Hi Jim,
I know it's too late, but for others, DON'T GRIND THE ATTENUATOR!!! Many of these stripline attenuators and terminators have beryllium oxide (BeO) insulators. BeO dust is highly toxic if inhaled or it gets into a cut. I don't know about the original 3W device but the higher power units definatly contain BeO. Oddly BeO caution markings seen a lot less common on American equipment compared to British.

Can't believe the Govt. didn't require a notice on the bombs alerting folks to the fact that the Berrylium could be a health hazard.

The Govt. is considering warnings on lead rounds alerting folks to the potential for "lead poisioning" but the argument is that the bullets go by so fast no body will be able to read it.

Many manufacturers of modern high power attenuators do not use beryllium oxide these days. They use Aluminum Nitride (AlN) which is more cost effective. The 100W 20dB Anaren attenuator I used was AIN so OK to grind. I doubt however the origonal 3W HP attenuator would be safe to grind. 73s Chris ZL1CVD.

Hi Jim,
1. Yes you need a PCMCIA card with direct memory addressing, not the "FAT" formatted IDE interface you get with a CF card in an adaptor. In theory you could make an adaptor that worked as the CF spec has a direct addressing mode. I suspect that many of the modern CF cards will not support this mode properly though.
2. Yes the HP software is good.
If you want a copy, contact me off-list, I can do list members a better price than on ebay.

Regards,
Robert G8RPI.

I do not think the flash card will work.  I tried it and have been told it will not work.

The RF Tools that HP puts out is totally differant than the one in Australia.
The HP version lets you set up the test set for some test easy.  One thing it does is give a distance to a fault in the coax cable that is hard to do without the RF Tools.

Other than that, I do not think it is really worth it for most people.

While you will have to buy the Australian version, I have seen some interface cables on ebay for a lot less than they are selling them for.

# 1068. Re: [hp8924] PCMCIA Cards

Yahoo group: hp8924
Date: 2012-09-03 20:24:04 UTC
From: Robert Atkinson
Topic: 1064  Message: 1068

PCMCIA  Cards. Having had a few more questions off list I thought I'd explain more of what I've found, I'm not an expert on this though.

This is a complex subject. PCMCIA (Personal Computer Memory Card International Association)is the original name, replaced by Pc Card. They can be 16 or 32 bit.
There are 3 basic types:
Type I 16bit 3.3mm thick
Type II 16 or 32 Bit 5.0 mm thick
Type III 16 or 32 Bit 10.5 mm thick
Note that these are primarily physical characteristics, not functional.
Originally designed for memory expansion they were available as RAM, Static RAM (SRAM, battery backed up) and ROM (including PROM and UV EPROM) functionality.
The PCMCIA cards were also used as external device interfaces.  The HP 8924C and 8920B support Type I RAM,
SRAM and ROM cards. The 8920A used a similar looking “EPSON” memory card with a single row of 40 contacts. These are hard to find and expensive.
Later cards, including Pc Cards, supported ATA (AT Attached) and IDE disk interfaces. Note that the early memory cards had direct addressing with random access, disks do not. Almost all FLASH storage cards used with PCs use the ATA/IDE disk interface, not direct addressing. PC operating systems recognise ATA cards as disk drives without specialist drivers or application software. Random access EEPROM and FLASH PCMCIA cards are available and are often described as linear flash. This is because of their linear addressing.  Even with a PCMCIA Type I Linear flash card
there are many variations apart from capacity.  There are four common types, Intel Series I & II and AMD Series C & D.  Then
there are attribute memory and other detail differences. Note that Linear Flash is much more expensive than ATA Flash. A new 2Mb Linear Flash card will cost between $50 and $150 depending on make and type.  The 8924C will read an Intel Type I as if it
were a ROM card. Note however that PC operating systems do not recognise Linear Flash. An application program and drivers are required to read and write to them.  The Intel type I cards require a 12V
programming voltage that is not supported by most PCs so a specialist reader/writer may be required. All in all this is a minefield and I’d tried many cards and readers before finding a combination that worked. It was not helped by HP not providing any information on their cards. I use Smart Technologies Intel Linear Flash series I cards.

# 1069. RE: [hp8924] PCMCIA Cards

Yahoo group: hp8924
Date: 2012-09-03 22:20:10 UTC
From: Jim Broome
Topic: 1064 Message: 1069

WOW! Thanks for all the time spent gathering this information!! It makes it easier and less expensive on all of us. Thanks very much.

From: hp8924@yahoogroups.com [mailto:hp8924@yahoogroups.com] On Behalf Of Robert Atkinson
Sent: Monday, September 03, 2012 4:24 PM
To: hp8924@yahoogroups.com
Subject: Re: [hp8924] PCMCIA Cards

PCMCIA Cards. Having had a few more questions off list I thought I'd explain more of what I've found, I'm not an expert on this though.

This is a complex subject. PCMCIA (Personal Computer Memory Card International Association)is the original name, replaced by Pc Card. They can be 16 or 32 bit.
There are 3 basic types:
Type I 16bit 3.3mm thick
Type II 16 or 32 Bit 5.0 mm thick
Type III 16 or 32 Bit 10.5 mm thick
Note that these are primarily physical characteristics, not functional. Originally designed for memory expansion they were available as RAM, Static RAM (SRAM, battery backed up) and ROM (including PROM and UV EPROM) functionality. The PCMCIA cards were also used as external device interfaces. The HP 8924C and 8920B support Type I RAM, SRAM and ROM cards. The 8920A used a similar looking “EPSON” memory card with a single row of 40 contacts. These are hard to find and expensive.
Later cards, including Pc Cards, supported ATA (AT Attached) and IDE disk interfaces. Note that the early memory cards had direct addressing with random access, disks do not. Almost all FLASH storage cards used with PCs use the ATA/IDE disk interface, not direct addressing. PC operating systems recognise ATA cards as disk drives without specialist drivers or application software. Random access EEPROM and FLASH PCMCIA cards are available and are often described as linear flash. This is because of their linear addressing. Even with a PCMCIA Type I Linear flash card there are many variations apart from capacity. There are four common types, Intel Series I & II and AMD Series C & D. Then there are attribute memory and other detail differences. Note that Linear Flash is much more expensive than ATA Flash. A new 2Mb Linear Flash card will cost between $50 and $150 depending on make and type. The 8924C will read an Intel Type I as if it were a ROM card. Note however that PC operating systems do not recognise Linear Flash. An application program and drivers are required to read and write to them. The Intel type I cards require a 12V programming voltage that is not supported by most PCs so a specialist reader/writer may be required. All in all this is a minefield and I’d tried many cards and readers before finding a combination that worked. It was not helped by HP not providing any information on their cards. I use Smart Technologies Intel Linear Flash series I cards.

Robert G8RPI.

Subject: Re: [hp8924] PCMCIA Cards

I do not think the flash card will work. I tried it and have been told it will not work.

The RF Tools that HP puts out is totally differant than the one in Australia.

The HP version lets you set up the test set for some test easy. One thing it does is give a distance to a fault in the coax cable that is hard to do without the RF Tools.

Other than that, I do not think it is really worth it for most people.

While you will have to buy the Australian version, I have seen some interface cables on ebay for a lot less than they are selling them for.

2 questions. . .

1. is the old style PCMCIA card the only way to get HP RF Tools loaded?? No way to use the flash card in a PCMCIA adapter ??

2. Is the HP RF Tools worth that expense?? Or save up for the Australian software and the cable to make it work??

Thanks,,

Here is what the manual says.  Do not delete the one that says poweron as this is the one that determins how the 8924c starts up.  You can delete it and it will revert to the default. No real harm is done if you do delete the poweron test. You can set the 8924c up like you want it and recreate the poweron name. Here is a place that tells how to do that.
http://www.amtronix.com/poweron.htm

Steps 2 and 3 are only hints on how to set it up.  You can change them to whatever you want the 8924c to start up as. Then do step 4 to save it.

To Remove (Clear) an Individual SAVE Register
1. Specify where the register is stored using the Save/Recall field on the I/O CONFIGURE screen.
2. Press the RECALL key.
3. Use the knob to position the cursor in front of the register to be removed from the Recall
menu at the bottom right of the screen. The register name and percentage of
SAVE memory occupied by that register are indicated at the very top of the screen.
4. Press the ON/OFF key. A prompt appears, asking if you want to delete the save register.
5. Press the ON/OFF key to select YES. (Press the RATIO W key to select NO.)

Jim , most of the things on the 8924 are simple....

YOu just have to find them in one of several manuals that is about the size of the New York telephone directory :-)

Also the 8924 manual is almost useless for anything but cell phones and you have to go to the 8920 manual and then find which buttton does what between the two.

You probably want to delete the whole setup tests and then set the poweron test the way you want it.
That is what I did and then added in a few other test setups that I often use.

That baby is working every day!! Got a bunch of things setup on the recall list. Tuned several repeaters for resale and some duplexers as well.

The on/off switch was bad, replaced some caps in the power supply and the monitor. All is well!!
How are you coming with yours??

From: Don
Topic: 1070  Message: 1077

So far so good on mine...

Glad you were able to fix the power supply and monitor issues. I have been using the external VGA monitor via the video adapter. Even though my monitor is fine, after using the VGA monitor I find it hard to go back to just the monitor on the 8924C. It is awesome to be able to see the 8924C's output on the large VGA monitor. No more squinting at the small monitor.

# 1078. EXTERNAL VIDIO FOR 8924c

Yahoo group: hp8924
Date: 2012-09-11 01:40:02 UTC
From: aa1pi
Topic: 1078  Message: 1078

Vidio for the 8924c
LM1881 circuit is built , not sure how to connect it to the GBS 8200.
I have pin 1 composite sync output connected to the green RCA plug on the
GBS 8200 v 4.0
pin 5 to power supply pos
pin 6 + 4 to ground POWER NEG
pin 2 composite vidio input from 8924c
pins 3,7,5 are not connected to anything.
With 8924c on and the LM1881 and GBS 8200 powered by a 5v power supply.
When I depress the auto button for over 5 seconds , when released I have
a green screen. No lines or words just a green color.
I am at a standstill here, are pins 3,5,7 to be connected someplace ?
Could someone point me in the right direction.
Thanks Bob AA1PI

Hi Don Thanks for the post the SYNC separator PDF is for the LM 393
and the 8200 mods is only a picture no schematic.

regards Bob

# 1082. Re: [hp8924] Re: EXTERNAL VIDIO FOR 8924c

Yahoo group: hp8924
Date: 2012-09-11 15:19:12 UTC
From: Robert Atkinson
Topic: 1078  Message: 1082

Hi Bob,
The Lm1881 does not pass the video through. You need to feed the composite video from the 8924C to BOTH the green input of the 8200 and to pin 2 of the LM19881 (via a 0.1uF capacitor) The sync outputs of the LM1881 go to P11 (or P11) Pin 3 of the LM1881 to the V sync input and pin 1 to the H sync input.
HTH,
Robert G8RPI.

From: donald_s_58103
Topic: 1083  Message: 1083

I just installed memory card explorer (from the files section of this Forum). It was very confusing to say the least since the directions are not clear. Anyway, I followed the meager installation instructions and I *think* the program has installed. I was not sure what to do with the two files (z02 and z01) but Winzip tells me that they are spanned zip files, so I am assuming that running the executable (memorycard.zip) will automatically consolidate the files and do the installation.

Now that I have installed it, I am not sure how to run the program. When I click on the program icon in Win XP, I see two choices for the memory card explorer program (one is simply labelled MCE and the other is labelled MCE (Auto Mem Win Setup). Which one of the two should I run? I did not want to just randomly run either one for fear of doing something irrevocable. I am looking for guidance from those who have successfully installed and run the program from the files obtained from the files section of this Forum. Thanks in advance for your input.

Don it has been a while and I do not remember what I did.

If you just want the RF tools program, you can go to the files section here and look under RF Tools & NA FM.zip

When you unzip this, you can use the Windows Explorer program anda drag and drop the files to the memory card.
You can use a card a lot smaller than the one required for the other program on here.

Thank you, Ralph! I had already downloaded the file you pointed to. I don't have a memory card yet, but hopefully, I should have one by the end of this week. It is just that it is not clear to me how to transfer the RF Tools program to the memory card using my laptop. Is windows explorer and the RF tools program that you pointed to all that's needed? I don't have to use the memory card explorer and the Opt100.bin file at all?

That is right.  You just download the rf tools files and I think they are zipped.  If so unzip them and just transfer them to the memory card like any file.  You may have to format the memory card, but that can be done in the 8924. I think I used a 256 K memory card with the seperate files.  They are mainly a text type file.  Written in Basic or really the HP instrument basic.  If you want to , you can use a program such as notepad or maybe word and edit them and resave the eddited program.

You do not have to use the Windows Explorer, but that is the program I use to transfer files between the hard drive and other devices such as the thumb drives.  Just easy for me to use.

The other way is to use a memory card that is atleast as big or bigger than the opt100.bin and the memory card explorer.  Instead of actually transferring a file, the bin is a binary image and it takes a special program such as the memory card explorer to transfer that over.  I am sure others can explain it beter, but that is the simple way as I see it.
The bin file is more of a memory dump from the 8924 to a card and then it was uploaded here.  Lots of unneeded bits in that file.

Thank you, Ralph! I had already downloaded the file you pointed to. I don't have a memory card yet, but hopefully, I should have one by the end of this week. It is just that it is not clear to me how to transfer the RF Tools program to the memory card using my laptop. Is windows explorer and the RF tools program that you pointed to all that's needed? I don't have to use the memory card explorer and the Opt100.bin file at all?

Thanks again, Ralph. I have both the bin file and the separate files downloaded and also have the Memory Card Explorer program installed. So if one method doesn't work, I can always try the other!

BTW do you know what the difference is between the two Memory Card Explorer executables that were installed when I installed the program? one is called MCE (Auto mem Win setup) and the other MCE (low Mem Win at D0000).

Hi Don,
What type of card are you grtting? The process depends on the card type as do the computer requirements.

Robert.

Hi Robert,

I will be getting an original HP SRAM PCMCIA card. It has some other option installed (not OPT100). I am planning on ersing the card and putting the RF Tools program on it. I do have an older laptop running Win XP which has a PCMCIA card slot.

Don

Hi Don,
Are you sure it's an SRAM card? I thought that the software option cards were ROM types. They did use SRAM cards but normally just for Setups and users own programs. The problem with SRAM is if the batttery discharges aor is not changed properly you loose the program. A ROM card of that era is most likely to be PROM (EPROM without the quartz window) which cannot be re-used.

Regards,
Robert.

Hi Robert,

I sure hope it is an SRAM card! Although it is an HP original card, it holds beta software and has the part # hand-written on the label. Also, the card has the small switch at the bottom for write-protection, so I am assuming (hoping) that it is not a PROM card and that it is an SRAM card.

Hi Don,
Definately an SRAM card.  They are the easiest to use. Format it in the 8924C and you should be able to drag and drop in Windows rather than having to use MCE.

Robert G8RPI.

From: Jim Broome
Topic: 1070  Message: 1095

Sorry to be a pain, but what PCMCIA card works. There are so dang many on Ebay, I don't want to get one that won't work.

One of the Amateur clubs that has some UHF repeaters in most of the communities locally is having problems with a cable situation at one of their sites. Seems that the owner put a firewall up in the attic of the building and must have damaged a cable. Want to use the cable fault finder app for a trial run. Gotta get a PCMCIA card for my baby.

Thanks. . . Jim W4JDB

Subject: RE: [hp8924] Instrument setups

Jim , most of the things on the 8924 are simple....

YOu just have to find them in one of several manuals that is about the size of the New York telephone directory :-)

Also the 8924 manual is almost useless for anything but cell phones and you have to go to the 8920 manual and then find which buttton does what between the two.

You probably want to delete the whole setup tests and then set the poweron test the way you want it.

That is what I did and then added in a few other test setups that I often use.

Hi Jim,
The only type that is sure to work is an SRAM card. You need atleast 512k for the card image or 128k for just the return loss. Looking at buy it nows on ebay.com, I can do you a programmed PROM card for less. I charge 35 UK Pounds (about $55 US) inc postage (airmail to USA) to list members. This includes RF Tools and North American FM tests. My ebay price is higher, see item 261096497748. If you want a card payment is by PayPal to this email address.

Regards,
Robert G8RPI.

Ebay number
220913294228

It is an Eiger 2 MB SRAM card.  On the back is P/N EPM-2000S

There are also some cards with an F on the end of the number instead of the S.  So becareful.  I do not know if the F versions will work or not.  The F card also has FLASH on the front instead of SRAM.  The FLASH is about $ 20 and the SRAM is about $ 100.

The 2 MB is large enough to do the image file ,  or you can just format the card in the 8924 and use any file transfer program to drag the files over.  I would do the drag file thing so you can use the card to store other setups.  I think the 8924 calls it initilize instead of fromat on the screen.

Also it seems that some computers will program the SRAM cards and some will not.  I could not get one to program at work on a laptop, but have a laptop at home that will program the cards fine.

If you do not already have them, you will need two things to use with the RF  Toosl program.  One is a return loss bridge.  You can buy them for over $ 100, but for general work a Mini Circuits ZFDC-20-5 will work well for a lot less.  This can be used for return loss measurments without the rf tools program also.  To do the cable fault program you will need a spliter.  Mini circuits makes them also.
Look in the rf tools manual to see how to use them.

You may try putting a good dummy load where the antenna is on the feedline and then doing a return loss.  If the return loss is very high, you may have a bad transmission line.
I have not been following the thread too close.  I hope you know what retrun loss is and how to apply it to things.  In its simplest form, it is just SWR expressed in other terms.

Good luck.

Sorry to be a pain, but what PCMCIA card works.  There are so dang many on Ebay,  I don’t want to get one that won’t work.
One of the Amateur clubs that has some UHF repeaters in most of the communities locally is having problems with a cable situation at one of their sites.  Seems that the owner put a firewall up in the attic of the building and must have damaged a cable.  Want to use the cable fault finder app for a trial run.  Gotta get a PCMCIA card for my baby.
Thanks. . .  Jim W4JDB

Jim
Considering how much the unit weighs, I would check with local hams or club members and see who has an antenna analyzer. They only weigh a few pounds compared to 60+.
Good luck
Rix

From: Don
Topic: 1083  Message: 1099

Well, got the card yesterday, and it IS an SRAM card!. Unfortunately, the CR2025 battery inside was dead as a doornail. Had to make a trip to Best Buy to buy a replacement battery. The card with the new battery was thankfully recognized by the 8924C and I was able to format it. However, while my laptop recognized the card and assigned it a drive letter, I was unable to access the card to transfer files(got an error message). Fortunately Plan B (using Memory Card Explorer) worked great and I was able to get RF Tools on the card and so far, the 8924 has not had any problems loading the programs. Haven't actually used any of the programs yet, just made sure they loaded.

BTW, any idea as to how long the battery will last in the card? I want to replace it before it dies.

Anyway, I followed the meager installation instructions and I *think* the program has installed. I was not sure what to do with the two files (z02 and z01) but Winzip tells me that they are spanned zip files, so I am assuming that running the executable (memorycard.zip) will automatically consolidate the files and do the installation.
> > > >

> > > > Now that I have installed it, I am not sure how to run the program. When I click on the program icon in Win XP, I see two choices for the memory card explorer program (one is simply labelled MCE and the other is labelled MCE (Auto Mem Win Setup). Which one of the two should I run? I did not want to just randomly run either one for fear of doing something irrevocable. I am looking for guidance from those who have successfully installed and run the program from the files obtained from the files section of this Forum. Thanks in advance for your input.

Fine on getting a card that works.
I think the battery will last a year or so.  The way I understand it, you can leave the card in the 8924 while changing the battery and you will not have to reprogram it.

I would not depend on the battery holding the program long term, just be ready to put in a new battery and reload the program a year or so from now.

I have two 256 K cards that have a rechargable battery inside it.  The card recharges from the device it is plugged into.  If fully charged it is suspose to hold the memory for about 6 months.  I think they rate the card as a 10 year life. They are probably near that now.

Hi Jim,
The only type that is sure to work is an SRAM card. You need atleast 512k for the card image or 128k for just the return loss. Looking at buy it nows on ebay.com, I can do you a programmed PROM card for less. I charge 35 UK Pounds (about $55 US) inc postage (airmail to USA) to list members. This includes RF Tools and North American FM tests. My ebay price is higher, see item 261096497748. If you want a card payment is by PayPal to this email address.

Regards,
Robert G8RPI.

Jim , most of the things on the 8924 are simple....

YOu just have to find them in one of several manuals that is about the size of the New York telephone directory :-)

Also the 8924 manual is almost useless for anything but cell phones and you have to go to the 8920 manual and then find which buttton does what between the two.

You probably want to delete the whole setup tests and then set the poweron test the way you want it.
That is what I did and then added in a few other test setups that I often use.

Hi Tom,
The total for a PROM card  programmed with 11807E Opt 100 ( System Support Tools Inc.RF Tools and North American FM tests) and a CD-ROM with the manuals is 35 UK Pounds (about $50-$60 US) including shipping by airmail. Payment by PayPal to this ewmail address is ideal.

Hi Don,
Great that the card works OK. The ability to drag and drop seems to depend on a number of factors. Firstly is how the 8924C formats the card. I've seen conflictining information on this and think that different setups or firmware vesion may do it differently. Second is the exact card type and the presence of drivers on the PC. The drivers seem to be propritary and not easally available. Some laptops have them some don't.

Regards.
Robert G8RPI.

Anyway, I followed the meager installation instructions and I *think* the program has installed. I was not sure what to do with the two files (z02 and z01) but Winzip tells me that they are spanned zip files, so I am assuming that running the executable (memorycard.zip) will automatically consolidate the files and do the installation.
> > > >
> > > > Now that I have installed it, I am not sure how to run the program. When I click on the program icon in Win XP, I see two choices for the memory card explorer program (one is simply labelled MCE and the other is labelled MCE (Auto Mem Win Setup). Which one of the two should I run? I did not want to just randomly run either one for fear of doing something irrevocable. I am looking for guidance from those who have successfully installed and run the program from the files obtained from the files section of this Forum. Thanks in advance for your input.

Yes, you do have a good deal Robert.

The card I got was much less, but I just wanted to show the other fellow  a card type that I know works.

Thanks for making the cards and also for the help you gave me a while back while I was trying to program a card.

Hi,
Sorry to advertise but you could buy a ready programmed Prom card for less. See item 261096497748, about $88 , less if you make an offer or even less if you contact me directly.

Regards,
Robert.

Jim

A low cost Time Domain Reflectometer is available at
http://www.epanorama.net/circuits/tdr.html

I built one "dead ant style", tweaked the timing capacitor, and it worked well with a 30MHz scope and 150MHz probes.

Demonstrated on a low bandwidth (5 to 10MHz) scope at the radio club with limited success.

regards
jim

From: BigFoot
Topic: 1108  Message: 1108

Hello
My duplex output level is about 7 db lower than it should be. I suppect it received some RF overload and toasted the output pad or whatever is there. Is this something you guys repair yourselves or do you have it sent off. Where can I get parts if I repair it and where would be the best place to send it if I can't repair it myself.
Thanks
Ben

Did you go into the setup area and check to see if the output is set for a 50 ohm or open circuit voltage ?  There is 6 db differance if I remember correctly.

Also most drop the output as you go lower than 30 mhz, but you probably know that.

# 1113. Screen capture problem....

Yahoo group: hp8924
Date: 2012-09-28 02:55:50 UTC
From: Don
Topic: 1113  Message: 1113

This Forum has been very quiet for the last several days, so I am hoping to stir up some activity!

I just got a DB9 female to RJ-11/12 adapter to use the BTS screen capture utility. I am able to capture the screen and save it as a bitmap file. However, I find that the very top part of the screen image is cut-off when it is captured. I have posted some pics showing this in the Photos section under Album "HP 8924C screen capture". Any one else having this problem? Any idea why this is happening and what I can do to fix it?

This is my setup for the screen capture:

Win XP laptop running BTS utility --->
USB-to-serial converter with Prolific chip ---->
DB9 Female to RJ-11 adapter ---->
RJ-11 cable ----> HP8924C

I think it's a problem using the USB to serial adapter. I'm using an older IBM think pad (P3) with XP. It has a serial port and I don't have any problems. My Think-Pad is networked and I can easily transfer the image to my I5 PC with no degradation of the image

I figured out the problem by trial and error. It is not the USB-to-serial adapter. It was the baud rate. I had set the baud rate to 19200 per instructions on the Amtronix site. When I changed the baud rate to 9600, the problem was solved.

Topic: 1113  Message: 1116

I would second that thought that the Prolific USB to serial is the problem.

I have struggled to make USB work with an older proprietary serial based SW program and ICOM ICR-9000 receiver. I tried a highly recommended model Staples offered, several different drivers, settings etc to no avail. I ended up dusting off an old COMPAQ computer with WIN 98 installed. Funny thing is that while at my client location running tests, two non IT tech people immediately commented I was running WIN 98! Embarrassing, till I showed them the serial port on the back.

I don't think these cheap ones can faithfully handle timing of the serial streams.

If anyone knows of a USB to serial interface that is truly "industrial grade" and actually faithfully emulates serial. I would love to know.

Joe,

You probably overlooked my earlier response...Everything is hunky-dory now. The USB-to-serial adapter works just fine. I just had to dial down the baud rate from 19200 to 9600. It takes just a wee bit longer to do the screen capture, but otherwise everything is as it should be.

I haven't played with the serial port on my 8924 yet, as long as they don't do anything "strange" most USB-232 adapter should work. HP/Agilent does some interesting things on their E645x units, and for those units the only adapter I could find that would work was one made by Rocket IO.

# 1119. 8924C Duplexer Tuning

Yahoo group: hp8924
Date: 2012-10-02 05:08:45 UTC
From: Bob - AF6D
Topic: 1119  Message: 1119

I am looking for a YouTube video that will show me step-by-step how to tune a duplexer. I'm just not getting it reading the written word.

I'd like to learn two ways. 1. I guess the traditional way by generating RF into the cans, and 2. Using an Amtronix 1200SW Return Loss Bridge.

I have two types of duplexers. My main is a Sinclair Q2330 and a WaCom WP642.

I'll confess that I get lost translating between the 8920B manual that doesn't appear to have a section on duplexer tuning, and the screens that appear on the 8924C. I do have the POWERON power-up enabled.

Thanks in advance.

A newbie

Bob - AF6D

Hello Bob,

I understand your frustration. I'm in much the same situation. I've had my 8924 for a couple of years, but just trying to tune a set of Motorola MSR-2000 UHF cans with it now. The results have not been good. Pass band tuning with a return loss bridge is simple enough, but I've never been able to set the notch frequency with the monitor. I even invested in the Measurement Innovation RF Tools software hoping to ease my pain and shorten the learning curve. No luck. I had to revert to the old, tried and true use of a an outboard receiver tuned to the notch frequency and use of the HP/Agilent as a signal source to tune for minimum signal. If I'm doing the math right, I was able to tune the notches within expected specifications using this method.

Here's one of the best videos I found: http://www.youtube.com/watch?v=P1wsG3FIU8w
The author is not using the 8924, but still some good information. You should see a list of similar videos on the right of the page before you hit the play button on this one.

That's not much, but maybe you will find some solace in knowing that another newbie is fighting the same battle....

Good luck. May the force be with you...

From: David Cameron
Topic: 1119  Message: 1121

The one important thing this video does not show is adjustment of the coupling loops to adjust the depth of the notch/pass. This is not easy to do, and can throw your whole duplexer out of tune and not able to meet spec if done wrong.

The Sinclair Q series ResLok duplexers are best tuned cavity by cavity, so get a Female-Male-Female N Tee, and two N to BNC cables.

The way I learned was by just playing around. Set it up on one cavity, at a span of 20 megs or so, and adjust everything you can on one cavity/loop until you get a full understanding of what each tuning input does. See how the frequency changes with the adjustment of the tuning rod, how the notches (yes there are TWO on each cavity) are adjusted with the capacitor. Loosen the loop and rotate it around a bit and see what the effect is.

Depending on the application, and the number of cavities, each loop need to be set to give it's fraction of the notch depth and pass loss. For a 4 cavity VHF, it is about 1dB pass loss for a 40dB notch, for a 6 cavity, about .5dB loss for a 30dB notch. After you have adjusted enough, you can set them all by eye :)

One note - if you are starting with a duplexer that was already tuned for a different frequency but the same split (600khz for example), don't play with the loops. They will likely be set fine.

Have a look at this site if you want to see what the dupes look like inside, or if you want to build a 220MHz duplexer :)

Thanks, John! Yes, the learning curve is steep and jumping back and forth between an 8920B manual and no manual is a task.

As far as I know the Res-Lok cannot be tuned cavity by cavity. The harness is one harness. One places a 50 ohm load at the end of the hi or low section and injects through the antenna port. I think :=) Or is that the RLB way ??? < Insert scream here! >

From: David Cameron (IRLP)
Topic: 1119  Message: 1124

Unless you have a weird version or something (I have seen some UHF versions that you can not remove the harness at the coupling loop), each of the cavities is added to the harness with an N connection. Have a look at my site where I dismantle the Q2220E duplexer and you can see all the various parts:

http://www.irlp.net/duplexer/

The harness is a whole other story. Most VHF Res-Loks you will see from the factory have a harness that is center tuned at 161Mhz. You will get about 5db deeper notch (per cavity) and slightly less pass loss (~0.05dB) if you center the harness around the operating frequency. This involves pulling the harness apart and replacing the inter-cavity pieces of RG-142 (I use RG-400), resoldering and recrimping. The formulas are all on the site above. Note that this is not NEEDED, but it does help a bit.

In my tuning of a single cavity for VHF ham band, I go from duplex out through a 10db attenuator (optional but recommended), to one side of the N Tee, from antenna in to the other side of the N Tee. I am using a 8920A, not an 8924.

I set my frequency for the pass freq, the span at 1.2Mhz (600khz on each side), 0db reference, 0db output, set to track, then I normalize the screen. I then attach the female side of the N Tee to the cavity under test.

Center the pass band around the middle of the screen (highest level), and then adjust the capacitor until the notch is in the depth of the edge of the screen (to the right the pass if the cavity is a low pass cavity, like a TX cavity for 147.200 - or to the left of the pass if the cavity is a high pass cavity, like the RX cavity on 147.800). Re-adjust the pass and the notch again. This centers the pass of the cavity, and adjusts the notch 600khz higher or lower.

Repeat for the other cavities. Be sure to know what is the high pass, and what is the low pass. When switching from tuning the high pass side cavities to the low pass side cavities, adjust the center frequency and RE-NORMALIZE.

For VHF ham band, the typical cavity in a Q2330 duplexer should show about 0.4-0.7dB PASS loss, and 25-35dB notch (Q2220E needs to be about 1.0-1.3dB loss with 35-45dB notch. If it does not, you may have to rotate the loop on the cavity by a few degrees, and retune. This is the mastery part of tuning duplexers - With the Res-Lok this is how you adjust the tradeoff between insertion loss and isolation.

Once all the cavities are set up right, put on the harness. Set your center frequency to the LOW PASS freq (147.20 TX). Take your cables off

the N Tee and connect them to an N male barrel connector. RE-NORMALIZE. Connect the duplex out and attenuator cable to the ANTENNA port, the antenna in cable to the LOW PASS equipment port, and put a 50 ohm dummy load on the HIGH PASS equipment port.

Now ever so slightly adjust the pass cavities to get the lowest pass loss. On a Q2330, it should be about 1.5-2.0dB. On a Q2220E, it will be about 2.0-2.5dB. You can temporarily turn off the normalization, and switch to a 2db/division setting to get a better view of the pass. Just be sure to go back to 10db/div before tuning the notch.

Now change the spectrum analyzer center frequency to the high pass frequency, and the reference level to -40. Now adjust the capacitors to line up the notches for the deepest notch. You will have to play around a lot to get it just perfect, but to be honest it doesn't really matter on a Q2330E. The notch depth should be AT LEAST the sum of the notch depths of the individual cavities, but likely about 5-10db deeper. Note that we did not RE-NORMALIZE when we changed the center frequency. Being off by 0.5dB on a notch is not the end of the world :)

REPEAT this on the HIGH PASS side, moving the antenna in to the HIGH PASS equipment port and the dummy load to the LOW PASS.

If any major tuning had to be done between the individual cavity tuning and the harnessed set, you should have a GOOD look at your harness. Test all ports for continuity, and open up the connectors to look for corrosion.

I should make some videos. I have tuned probably 50 Sinclair Res-Lok dupes in my days. All without an RLB, and they all work great :)

Topic: 1119  Message: 1125

Thank you David for the best step-by-step on this process I have seen!

I've already pasted your information into my "Duplexer Tuning" folder for safe-keeping and easy reference.

Bob is the originator of this tread and I don't want to send it too far off in another direction... but I'm going to toss in a new variable into the discussion. The Motorola MSR2000 duplexer I've been wrestling with is the T4080a 4-cavity 406-540 MHz series. The cable kit is cut for the 430-470 portion of the band.  The interconnection between each cavity is soldered - there are no PL or N connectors, so you have to tune each side (two cans) at a time. If I had had your email before I started this project, I would never have TOUCHED those blasted "notch coupling loops & notch coupling probes." They have caused me immeasurable hours of grief. No matter what I tried, I could never "see" a decent notch on the spectrum analyzer. That's why I reverted back to trying to notch out a signal using an S-meter instead of using lab-quality equipment (with a newbie equipment operator at the controls ).

I will take another shot at it tonight after I digest the good information here.

John / WB5NFC

Never touched one of those yet. Thanks for the warning :) I can't find
any reference to that duplexer, but this may help you:

http://www.cactus-intertie.org/LA/tec_not6.pdf

You may want to try the repeater-builder Yahoo group also.

I think I will stick to the Res-Lok :)

> Bob is the originator of this tread and I don't want to send it too far off in another
direction... but I'm going to toss in a new variable into the discussion. The Motorola
MSR2000 duplexer I've been wrestling with is the T4080a 4-cavity 406-540 MHz series. The
cable kit is cut for the 430-470 portion of the band. The interconnection between each
cavity is soldered - there are no PL or N connectors, so you have to tune each side (two
cans) at a time. If I had had your email before I started this project, I would never have
TOUCHED those blasted "notch coupling loops & notch coupling probes." They have caused me
immeasurable hours of grief. No matter what I tried, I could never "see" a decent notch on
the spectrum analyzer. That's why I reverted back to trying to notch out a signal using an
S-meter instead of using lab-quality equipment (with a newbie equipment operator at the
controls ).

You should be aware that the "E" model lacks a lot of the features that are used in two way testing. Go to Agilent's website and look closely at the specs for that "E" model before you buy. I got one for cheap and it is a doorstop. I bought it for spares for my "C" that hardly gets used.

From: crcrane@sbcglobal.net
Topic: 1128  Message: 1128

I built the cable from the diagram shown on the link previously posted. I have tried both 19200 and 9600 but I can't get it to work. I am using WinXP on a CF-18 Toughbook.

At one point I did see a bunch of gibberish one one of the screens but I can't recall which one I had open at the time and what I did to get that to happen. Other than that all I ever get is a warning on the 8924's screen indicating something about a port overflow.

What software are you using to capture the data?
Is it going direct to a hardware serial port, or through a USB adapter?
Are you sure the hardware serial port is set up in the BIOS?
Have you tried to use a program like hyperterminal with a jumper from
pin 2 to pin 3 to verify that the serial port is working correctly?

I have only had experience using a program called printcapture with my
HP8920A to capture screenshots from the monitor.

I'm using the BTS Laptop utility with my HP8924C. It's going directly to COM 1 which is a real deal built in port on the PC. The port works fine with any other program so I am of the belief there is nothing in the bios wrong.

# 1133. Re: 8924C Duplexer Tuning

Yahoo group: hp8924
Date: 2012-10-03 04:34:11 UTC
From: Bob - AF6D
Topic: 1119  Message: 1133

DOH! How could I have been so stupid. Of course they disconnect at each can. DOH! But then again the Sinclair instructions wants the three cans on each side tuned as one unit. I have the actual Sinclair document but I also have another document detailing one at a time. I don't know what harness I have or what insertion loss loop. But I know that I have -111dBm isolation and zero desense. The only reason I want to tune is to get rid of the 4 watts of reflected power. Someone else also tuned them without me present and I want to know how to tune.

From: Bob - AF6D
Topic: 1119  Message: 1134

David,

I have the Q2330e model (6-cavity). When purchased all of the rods were "pushed all the way in for shipping." Which is another way of saying that the idiot cut all of the rods. We had to source INVAR rod and did so at an excellent price. Prior to the replacement of the rods we couldn't get below 151MHz and now we're well into the ham band with excellent rejection and isolation. Although I do have higher loss on TX than I'd like. On receive I an get down below -121dBm - no man's land anyway.

My issue is that I just don't know how to setup the 8924C to begin tuning. I haven't been able to locate a video or written instructions. I need a starting point. For the life of me I cannot find the instructions I had for using the Amtronix SW1200N Return Loss Bridge to tune. I also have a WaCom WP642 6-cavity. Same issue. Setting up the 8924C.

I would be grateful to anyone that can push me in the right direction Not over a cliff, if you don't mind :=)

Bob, it sounds like you have it tuned just fine. What are you defining as "high loss on TX"? If you put a wattmeter before and after the duplexer on the TX side, what readings are you getting?

You also mention reflected power of 4 watts. 4 watts of how many going in? Also you have not mentioned if you have done any or all of these tests with the antenna port terminated with a good 50ohm dummy load.

I can tell you the setup steps for an HP8920A, but not sure if the 8924C is the same or not.

# 1137. Re: 8924C Duplexer Tuning

Yahoo group: hp8924
Date: 2012-10-03 15:32:10 UTC
From: Bob - AF6D
Topic: 1119  Message: 1137

Great questions, David.

I did not tune the duplexer the first time and was not present when it was done. It was tuned and delivered. I need to know how to maintain my hardware.

The 4 watts reflected is of 35 watts. I believe that's 11%? But yes the port was terminated with a Telewave TWL60.

The steps are similar on the 8920A but I cannot tell you how. I am going to review the pages Tim linked to.

Thanks!

Set it up on one cavity, at a span of 20 megs or so, and adjust everything you can on one cavity/loop until you get a full understanding of what each tuning input does. See how the frequency changes with the adjustment of the tuning rod, how the notches (yes there are TWO on each cavity) are adjusted with the capacitor. Loosen the loop and rotate it around a bit and see what the effect is.
> > >>
> > >> Depending on the application, and the number of cavities, each loop need to be set to give it's fraction of the notch depth and pass loss. For a 4 cavity VHF, it is about 1dB pass loss for a 40dB notch, for a 6 cavity, about .5dB loss for a 30dB notch. After you have adjusted enough, you can set them all by eye :)

The results have not been good. Pass band tuning with a return loss bridge is simple enough, but I've never been able to set the notch frequency with the monitor. I even invested in the Measurement Innovation RF Tools software hoping to ease my pain and shorten the learning curve. No luck. I had to revert to the old, tried and true use of a an outboard receiver tuned to the notch frequency and use of the HP/Agilent as a signal source to tune for minimum signal. If I'm doing the math right, I was able to tune the notches

within expected specifications using this method.

Bob, You may be able to improve the 4 watts reflected by tuning the pass frequency with the RLB. When you achieve the maximum return loss, that corresponds to the best SWR you can get. Example, return loss of 14 db is about 1.50 to 1 VSWR, about 4% of the incident power (25W forward, 1W reflected for example). Tuning the pass without a RLB can result in a higher SWR / reflected power. Briann1bs

Subject: Re: [hp8924] Re: 8924C Duplexer Tuning

Bob, it sounds like you have it tuned just fine. What are you defining as "high loss on TX"? If you put a wattmeter before and after the duplexer on the TX side, what readings are you getting?

You also mention reflected power of 4 watts. 4 watts of how many going in? Also you have not mentioned if you have done any or all of these tests with the antenna port terminated with a good 50ohm dummy load.

I can tell you the setup steps for an HP8920A, but not sure if the 8924C is the same or not.

Subject: [hp8924] Re: 8924C Duplexer Tuning

David,

I have the Q2330e model (6-cavity). When purchased all of the rods were "pushed all the way in for shipping." Which is another way of saying that the idiot cut all of the rods. We had to source INVAR rod and did so at an excellent price. Prior to the replacement of the rods we couldn't get below 151MHz and now we're well into the ham band with excellent rejection and isolation. Although I do have higher loss on TX than I'd like. On receive I an get down below -121dBm - no man's land anyway.

My issue is that I just don't know how to setup the 8924C to begin tuning. I haven't been able to locate a video or written instructions. I need a starting point. For the life of me I cannot find the instructions I had for using the Amtronix SW1200N Return Loss Bridge to tune. I also have a WaCom WP642 6-cavity. Same issue. Setting up the 8924C.

I would be grateful to anyone that can push me in the right direction Not over a cliff, if you don't mind :=)

# 1139. EDACS test software

Yahoo group: hp8924
Date: 2012-10-04 01:04:52 UTC
From: mojoehand
Topic: 1139 Message: 1139

I managed to get a 9122D HPIB floppy working on an HP 8920A. As you know, this model uses a non-PCMCIA card, making it difficult to get files on and off the device.

I copied all of the files from the EDACS software ROM card to a DOS floppy and then to a USB thumb drive. The files have been Zipped and uploaded to the Files section. Look for the following file.

"HP 11807A Option 011 Rev B.00.01 (EDACS).zip"

I remember that someone had asked for this software in the past. I'd like to hear if it works for anyone. This software is for the 8920A. I don't know if it will run on later models. It won't run on models that don't have the EDACS, LTR, etc. signalling options (like my E8285A).

The original ROM card was formatted as LIF. Copying the files to a DOS format changed the file names to all uppercase. I renamed them to the original mixed-case under Win7. This was more for looks, as I don't think it will matter when running the software.

Under LIF, the first letter of the file name indicates the type of file. A "p" is a procedure file, an "l" is a library file and a "c" is code (HP BASIC).

Let me know if anyone tries this software.

I tried this on an 8924C.  To get it to list the files on the screen I renamed the files by deleating the first leter and using that as an extension as you have at the bottlom of your post.  That is deleting the p and using .prc,  l to .lib and c to .pgm

The 8924C loads the program but gets an error at line 950.  I do not know enough about HP Basic to under stand what the line means when I loaded it to Wordpad on the computer, but it seems to be checking for something.  My guess it is either a HP modle number or maybe there is a place where it searches for a certain option.

My 8924C runs the RF tools that someone posted here a while back.  It will not run a program labled NA_FM that was included with the RF Tools for a similar reason.  I bet the program will run on the correct machines.

From: mojoehand
Topic: 1139  Message: 1141

I just looked it up and the 8924C should have the EDACS signalling built in, so that isn't the issue.

Looking at line 950, it seems to be parsing what filters are installed (I think). This is what the EDACS software manual says:

"HP 8920A Option 010: 400 Hz High-Pass Filter (HPF) (for tests 04-09)"

I would think that a missing option shouldn't crash the program. However, if I remember, running the FM tests also stopped on something similar. It may not be a missing option, but how the program interogates the hardware, looking for those options. In other words, the 8920A probably reacts differently to the program than later models.

When I have nothing else to do (yeah, right), I want to try debugging the FM tools to see if I can get it running on my E8285A. If I figure that out, it may be something similar is required for the EDACS software.

BTW, your renaming of the files and adding extensions is probably the correct thing to do on DOS. I see that the RF tools are named similarly.

If anyone wants to try the files on a LIF volume, I found some LIF Utilities on the HP Museum site, under the Vectra section (The Vectra was an early HP PC compatible). There is also a copy of Instrument BASIC for Windows 3.0. It might be interesting to see if that even runs on my Win7 box.

Ralph,

I just uploaded another file, "EDACS2.zip". Give this a try.

This time, I copied the files from the LIF formatted ROM card to a LIF floppy. Then, using the HP LIF Utilities, I copied everything to DOS. I see that the program file got converted to readable ASCII under DOS. Last, I renamed the files, adding the extensions.

If this still doesn't work, then the program will definitely need some modifications for later model service monitors.

It would be very interesting to hear from someone who has tried this on an 8920.

From: Ralph Mowery
Topic: 1139  Message: 1143

I finally found some time to try the EDACS2 file.  When I loaded it into my 8924C it would give several file names, but when I clicked on then, none of the files would load. The screen said something like 'file name undefined'.  The screen did show the EDACS when I put the memory card in and first started up the listings for the card.

I think the error that I got on line 950 in the first time I tried it by just renaming the files to the correct extention for the 8924C was the program looking for certain hardwear options on the test set.  The 8924C has most of the options of the 8920 already standard where the 8920 does not have most of the options standard so it needs to check for them.

As I said, I know a small ammount about BASIC, but nothing about the HP IBASIC.  I am sure they work the same, just some differant commands to work with the HP instruments.
I bet it has been 20 years ago that I last saw anything in BASIC.

Ralph

We had to source INVAR rod and did so at an excellent price. Prior to the replacement of the rods we couldn't get below 151MHz and now we're well into the ham band with excellent rejection and isolation. Although I do have higher loss on TX than I'd like. On receive I an get down below -121dBm - no man's land anyway.

Use AF gen 2 and enter the tone with a decimal first. Ex 100.0 hertz would be .10000
You set the output to FM and set level to whatever you want

Indeed use AF gen2, but ...

Enter 100 and hit the HZ button lower right corner of number pad
for other stuff enter the ghz, mhz, khz keys after the number/digit entry.

Mark

From: Bob - AF6D
Topic: 1145  Message: 1150

I was able to generate the PL tone and an RF carrier but no 1KHz tone.

I hit something wrong and the unit reverted to CDMA. How can I return to POWERON without power cycling?

I am testing for desense with a UHF T with the center pin cut shorter. I assume that rather than duplex out I am using the main RF Out because it can handle 100 watts? Duplex can only handle 200mW.

You guys are great!

Topic: 1145  Message: 1151

I got it to work the second time and after rebooting. I rebooted because I ended up in CDMA mode and did not know how to return to POWERON mode.

At any rate I found this one step simpler. Just by going to the RF Generator screen I could enter AFreq1 and then AFreq2 for the PL tone. Using a small mobile mag mount antenna I was able to transmit enough signal to open squelch. Later today I'll make an ISO-Tee and then attempt to measure desense with the transmitter on.

From: abrigno1
Topic: 1152  Message: 1152

I thought I understood this but have become confused. I haven't used this in several months and when I went to it last night I got thoroughtly confused agian. Need quick explanation of how it works.

What I thought I understood was to go to the Track Gen and set up to sweep a DUT. Then go to the Aux [Normalize] screen and hook up all the cables etc without the DUT and then hit "Save B".

Then go back and hook up DUT and and hit select A only. Then hit Select A-B and reading that would appear would be difference.

Is this the correct sequence???

I think you have steps 1 and 2 reversed. "A only" first, bypass your DUT, "save B", then A-B

Topic: 1152  Message: 1154

You set everything up the way you want, except for the DUT.  This should be done with the A only hilighted.  Then you hit Save B.  This zeros out everything to this point. Hook up the DUT. Then you hit Select A-B.  Now you are ready to see what the DUT is.

 If you change anything other than the DUT, you will have to go back to the A only, make the changes, and do the A-B. Then hook the DUT back up.

From: jistabout
Topic: 1155  Message: 1155

Hi everyone!

Can't figure out how to do this.....

If I input a signal of, say, -25db (or other low level) into the antenna port on my 8924c, how can I directly measure the level of said signal on the 8924c?

Seems that I can set the built-in AC voltmeter to read signal levels at the antenna port, but the readings change with the different demodulators and also seem to be inaccurate so perhaps I'm doing something wrong.

Thoughts appreciated :).

From: Ralph Mowery
Topic: 1155  Message: 1157

The first thing that comes to my mind is to use the spectrum analizer function.  Turn off the tracking generaor or set it very low.  Then move the marker to the desired frequency and read the ammount of db on the right side of the screen about 1/3 the way from the top.

From: Bob - AF6D
Topic: 1158  Message: 1158

Humbly suggested, I am not a dummy and I am not stupid. But I am having a heck of a time. I cannot find a manual, video or otherwise that shows actual setup of an 8924c to use a SW1200N Return Loss Bridge to measure my Res-Lok Q2330. I have a desense issue and it has been suggested that although I was told that my duplexer was tuned to 111dB notch it is acting more like 85dB. I cannot verify one way or another until I get past this learning curve. I have ann excellent Angle Linear 2 cavity bandpass and it comes with a 17dB preamp.

The duplexer came from eBay. The seller lied about it and stated that it covered 136-174MHz. Not knowing the difference I got it cheap, only to learn that the rods were pushed all the way down "for shipping." We couldn't get it to the target of 147.705/105. We sourced INVAR and made new rods. Internally my associate fabricated proper plunger mounting and reported 111dB. He cleaned up the Q2330 and all seemed OK except on weak signals. The harness was not changed and the duplexer had been tuned for government stuff up at around 170MHz.

I have looked at the 8920B manual at http://www.manteoelectronics.com/Application_Handbook.pdf and do not see duplexer tuning. Call me names, call me Suzy; call me late for dinner. But is there a manual somewhere for dummies like me?

Frustrated and humble,

Bob

Actually, yes and no. It appears that the max signal out of the HP in "DUPLEX" mode is -21 db. So when looking at the notch depth, the spectrum analyzer references it's scale from 0 db. So if we take -21 db reference point and add 90 db of duplexer notch, the spectrum analyzer will show the notch at -111 db on it's screen.

In reverse the -111 db spectrum analyzer result minus the -21 db starting point gives you 90 db of duplexer notch. Exactly what I should have out of that duplexer.

So we're both correct :=) I've read that with the proper harness one can get that extra 5dB. I didn't change it but it may have been changed by a prior owner. I don't know. :=(

I need a nap. I should have bought a new duplexer pretuned and a simpler service monitor. One with training wheels. I feel so incapable right now.

Working from memory (something akin to using a camera without any film) but:

1) I think you should get more than -21 out of the Sig Gen in Duplex and
2) You don't need to be in duplex mode

Go from RF Out to Antenna In, set the Sig Gen for some value (-20 dB for example) at your frequency of interest. Turn off any modulation. Go to the Spec An and you should see a spectrum at the same level (-20 dB) that you selected. At some point near 0 dB, it'll start to fall off... but not at -21 dB. (Don't forget to account for cable loss... I use short runs of REAL RG-214 about 18" long).

If the cans are rated at -85 dB, I can see you getting 90 dB out of them pretty realistically, although I've never worked with these particular units. BUT, it's darn hard, if not impossible, to see -90 dB of isolation. I can't recall the specs for the -8924, but I belive that at 90 dB you're approaching the limits of the instruments dynamic range.

I have often used a receiver ot verify the depth of my notches. Do a SINAD measurement at the frequency of interest (notch frequency), then insert the duplexers into the line and repeat the measurement. The difference between the two measurements will be your notch depth (with the limfac being your abilty to measure SINAD accurately), assuming your signal generator is accurately putting out what it says it is.

How much isolation does CommShop tell you you need?

Topic: 1158  Message: 1163

I did not reach that conclusion. Another Elmer did so I cannot take credit for being that smart.

At least you still have a memory LOL! I lost mine a long time ago. I've been living out of a children's cancer hospital with my daughter and trying to learn how to build an effective repeater at the same time. The vault is in place but needs to AC lines run underground along with the hard line in PVC. The trenches are dug. The antenna is mounted 85 feet up, a DB224e using Andrew's /2" hard line. But here at the house on a test antenna with LMR-400 and close proximity we suddenly have desense that we're trying to track down. I am going to replace the LMR with some 1/2" that I have and try again. But it appears that the Angle Linear 17dB preamp may be too much.

Using your instructions below will that show me the notch of the duplexer? I'd like to be in tune mode. I know that I have .23dB loss currently and that is actually OK. Our amp won't run so hot. I have not run a SINAD test but the squelch with PL opens at -121dBm. The receiver is tested at .18uV.

I'll follow your advice and see what I get. I am moldable. Just tell me how to learn this darn thing.

My humble thanks.

Bob
Just some food for thought.
Did you look at the Amtronix website? I got some really good hints for the 8924 from them.
We also have a preamp on our receivers. For a multitude of reasons, we have to put in atten pads to keep the receiver from overloading however.
Sound familiar???
Are you sure your desense is not being caused by your feedline? Most recommend only using silver plated dual braid shielded coax if using the feedline for both xmit and rcve.
And last but not least, you are only a dummy if you don't ask and you are a dummy for calling the other guy the same.
As you learn the 8924 you will find it to be one h*** of a box.
Good luck.

From: Bob - AF6D
Topic: 1158  Message: 1165

I don't mind asking questions but in some groups it might be frowned on. Rick has some tutorials and has been very helpful in the past. But I cannot find one that matches "Tuning a Duplexer with a SW1200N Return Loss Bridge and a 8924C". His tutorial is for an IFR and I am so green that I cannot convert in my head. But I am trying.

I think that we've narrowed down the desense to signal overload.

Look at this vidio.  It uses an E8285 and the screens are almost the same as the 8924C.

http://www.youtube.com/watch?v=P1wsG3FIU8w&feature=relmfu

 Here is for a single cavity

http://www.youtube.com/watch?v=bl5Nyn85SFs&feature=relmfu

You tune the duplexer pass frequency with the return loss bridge.  Then you take the RLB out of line and tune the duplexer for the rejection notches.

It may be of help to you if you think of the RLB as just a SWR meter which it really is, just a bit more fancy and you get  DB instead of a ratio.
The two will directly equal each other if you have a chart that tells how many db equal the the swr.

Hi Bob,
Try searching the agilent website (and Google) for manuals and tutorials on the HP 8920 (A or B). The labels on the buttons may be different, but the heart of the 8924C is an 8920B. The 8920x  was marketed at analog comms so there is more relevant info out there than there is for the CDMA cell phone 8924C. Pardon the plug, but the RF tools software can help with testing too.

Robert G8RPI.

# 1168. Re: Measure signal levels in dbm?

Yahoo group: hp8924
Date: 2012-10-18 14:13:19 UTC
From: Joe Leikhim
Topic: 1155  Message: 1168

The signal you are measuring has to be a 50 ohm source to read properly.

You're awesome, Ralph. Rick also emailed me instructions to tune using a Return Loss Bridge. For the benefit of others they are:

The Amtronix SW2012N will work identical to the "IFR" bridge. Basically, you put a 50 ohm load on the antenna port of the duplexer, 8924c duplex out to the SW2012N input, SW2012N output to 8924C antenna input, SW2012N "DUT" port to the transmitter side of your duplexer. Sweep +/- 2 or 3 MHz . Tune duplexer for highest return loss (lowest SWR) at the transmitter frequency. The return loss at your tx freq should be about 20dB. This will take care of the transmitter side.

Hope this is useful to someone else.

Topic: 1158  Message: 1171

I was able to get a nice notch using a Return Loss Bridge but now I need to know the steps preferred (I am told) for tuning a duplexer.

# 1172. Setting Up an 8924C for Duplexer Tuning

Yahoo group: hp8924
Date: 2012-10-21 17:18:07 UTC
From: Bob - AF6D
Topic: 1172  Message: 1172

I am guessing as I do this with my head filled by other hams saying do this; no do THIS. Please help.

How do I setup the Duplex page of the 8924X and then the Spec Anl screen to tune a duplexer (WaCom WP-642).

I am assuming that Duplex out goes to my Ant In on the duplexer and the end ofg the cans goes to the RF In???

You really need to find someone local to your area, who knows the 8924 or the 8920A/B to come over and walk over it with you. You should be able to find someone through this group.

If you leave the RLB out of the process, you can do it following the directions I posted a few weeks back, as long as the duplexer is already tuned for a 600khz offset. That way you don't have to adjust the coupling loops.

I sent directions on how to do a Q2220e or Q2330e dupe.

Bob,
I think your comment is way out of line. Please do not respond like that on this list. You have been asking the same questions over and over on this list and the repeater builder list and everyone that tries to help you gets comments like the one below. I think you should go back and read all the suggestions and information that you have been given and then sit down with your service monitor and figure it out. It seems to me that you are making this whole situation harder on yourself than it should be.

Ray Retzlaff

Bob,
You do not normally use the Duplex port of the 892#x for tuning duplexers. You use the RF out and Antenna ports.
If you look at the Amtronix "IFR" link that you derided you will se that it contains a hot link to a 8920 appliction note.

Robert G8RPI.

Well, considering that the principle is the same, regardless of what service monitor you use, and the fact that what I posted tells you that there is also a section in the HP 8920A manual on how to do this, I figured that instructions from Amtronix might be helpful.

For my efforts, I get a nasty reply from you, with you screaming at me. If you want to throw a tantrum because I couldn't spoonfeed you just exactly what you wanted, because you are incapable of extrapolating useful information onto your situation, all I can say is **** ***. Don't look for any more help from me.

I apologize. I am a guy that asks specific questions and hopes for an answer to the actual question. I have been sent the instructions for an IFR several times. The other list is not relevant here except to say there I asked where to buy a crystal filter and you see where it went. I will conduct myself accordingly.

> I think your comment is way out of line. Please do not respond like that on this list. You have been asking the same questions over and over on this list and the repeater builder list and everyone that tries to help you gets comments like the one below. I think you should go back and read all the suggestions and information that you have been given and then sit down with your service monitor and figure it out. It seems to me that you are making this whole situation harder on yourself than it should be.

I again apologize but the copy Amtronix has sent me several times does not have a link to an 8920 application note. I really am just a new guy trying to learn and have a whole bunch of people telling me different ways to do things, it jumbles in my head, and when I can't make sense of it they think I'm not doing as asked. I have not been told until now that I use the RF port and the Antenna port. I will try that right away. Thank you for your time.

Please accept my apology. In have asked this question a couple of times and I keep getting sent the Amtronix paper titled "Duplexer Tuning with the Amtronix SW2012N RLB" which is the same as the web address you gave me. It is just frustration coming out. Again I apologize.

If I understand you correctly I am supposed to be using a Return Loss Bridge and maybe this is where I haven't been clear. I am trying to do this without a RLB. I also read each line of the link you gave me and I can't find a link to the 8920. I was rude and don't expect you'll be inclined, but could you post the link that I cannot find? I really would appreciate it. I can tune using the RLB but then what about th4e RX side?

From: Tony Brignole
Topic: 1172  Message: 1183

See page 207 of the HP8920A & B manual HP part no. 08920-90126 dated April 1996 Rev C.

Page 205 says that the tracking generator output is provided at either the front panel RF IN/Out or the Duplex Out Connector. [obviously you have to select right one in menu]

page 206 under Basic Measurements with the Tracking Generator item 1. "Connect the signal input to the RF IN/OUT or the Duplex Out Connector".

On several subsequent pages it shows examples where the output is from the Duplex out and the input is to the Antenna In on the HP 8920.

Some of the guys that are "super knowledgable" may want to drop HP a line and point out the errors in the manual.

I have a PDF of the applications manual and can email it to you but it is best off list as it is over 3 meg and will take awhile.

Contact me at abrigno@comcast.net.

Linked from the original page that started this flame storm:

http://www.amtronix.com/duplexertuning.htm

At the bottom of the third paragraph, there is a link to the manual you
want. This was the reference to the 8920A/B from that IFR page:

http://cp.literature.agilent.com/litweb/pdf/08920-90126.pdf

Also, about 3 weeks ago I sent you a good step by step way that I tune
VHF duplexers.

Actually, if you look at Message 1161 (17 Oct 2012), I told you to use the RF Port and the Antenna Port.

I (and a lot of others) am really trying to be helpful, but (like others) I□m getting frustrated with this thread. You simply cannot tune ANYTHING until you understand how to use the instrument. Once you get the -8924 to come up like an -8920 (already been explained) it□s very similar to the -8920. The buttons and keys may have some slight differences in labeling, but the instrument operates very similarly and it should not be difficult to extrapolate.

When I got my -8924, I□d already used an -8920, but it had been many, many years. All I did is set down in front of it with some cables, adapters, and a couple of attenuators and started playing with it. Within an hour or so, I□d pretty well mastered everything I needed to know to tune transmitters, receivers, duplexers, etc. If you□ve never used an -8920 before, it□ll take longer, but with a copy of the -8920 manual, you can work your way through the 8924. With the help of some videos on YouTube and the instructions on the Amtronix site, it just ain□t that hard.

I recall a recent post on □the other group□ where you asked for a source for attenuators. At the time, I really wondered why you couldn□t figure that out on your own but I posted an answer anyway as did 5 or 6 other folks all within an hour or so. Bottom line: All this reinforces the axiom: God helps those who Google it themselves.

Good luck Bob I hope you get all your issues solved, but I□m done. Do what I did, sit down in front of it and figure the damn thing out. Once you know how to use it, it□ll be easy enough for an extra class (code and all) like yourself to start tuning duplexers et al.

Mike,

I am off list because I am tired of getting yelled at. I am getting conflicting information. I 3was told an hour ago to use the antenna port and not the duplex port, only to be told in another message not to use the duplex port but to use the antenna port. Yet the 8920 manual pictures using the RF port and the duplex port. I am trying but I find it hard to work with conflicting information. I've just been sent the 8920 manual again but not told the sections to read. I guess that I'll read them all. I can do a lot of things on the 8924c. I just cannot tune without an RLB. You act as if I am not listening to you. I am listening to everyone that that is working against me.

All,

This was a response to a private message that was sent to Bob by myself. Obviously he chooses to use multiple email addresses and as several have suggested, is probably spoofing email addresses.

I tried to help the man in good faith and this is how he chooses to treat me.

Reap what you sow, Bob... and may God bless you; you surely need it.

Bob,
I don't know what you do for a living and this may well be irrelevant but I will offer it anyway for your consideration.
Have you thought of looking for a job as a LMR tech. assistant or installer? Being around this stuff all day does wonders for the assimilation of concepts that may not be immediately evident to the untrained eye. In addition, you most likely will have ready availability to a source of immediate answers to your questions and , most likely, demonstrations.
All in all, its really not a bad job. I just finished up 50+ years of it and, in the final analysis, I could have done a lot worse. For me, the pay wasn't great but that appears to be changing (finally!) as fewer ETs have hands on experience in analog, and, specifically, RF areas.
Just a thought for your consideration.
Tom

By the way, HOW does one YELL at someone on a typewritten page??? Does it REALLY hurt your ears (or just your ego?)? And NO, I don't buy that baloney about typing in capitals. That is merely TYPING IN CAPITALS! Perhaps there is some type of new wireless communication taking place here that I'm not aware of???

Guys, at the risk of taking sides (believe me, I am not taking sides) perhaps no one has considered that, from what I have read in earlier posts, Bob is already going through trials that I couldn't wish on my worst enemy. That constant fear that a loved one will suddenly, and, maybe irreversibly, take a turn for the worse has got to be a burden that few of us can bear gracefully. I know, I, too, am facing a similar challenge now and have in the past. I can't even begin to imagine what a PITA I was to those around me at work and, try as you might, sometimes there's just not enough fight left in you to "leave it at home!" as the saying goes.
And stating that the Creator (GOD, to me) will repay one, in kind, has got to cut deeper that any knife ever could. If one truly wants to hurt someone, that's surely the way to do it!
How about EVERYONE just drop this whole thread; maybe the owner should just delete it all; and start over a few days from now? Too many people have shot themselves in the foot here, no doubt ALL unintentionally.

Attachments: 1 described; binary payloads are missing from this source WARC

See if this helps. The controls are very very similar but not exact so think ahead a little. Also, these manuals leave a lot to be desired.

This manual is a hoss.

You can sweep cavities with the tracking generator and then fine tune with the RLB if needed. RLB is best but not totaly essential.

Find the knobs/screws etc on your cavities so you know what to turn and what does what.

There are 2 controls. One controls the space between the dip and the peak and one moves the whole shooting match. Set the space between the peak and the dip to around 600 KHz and then move whole sequence to right place. These slightly interact so when you get them very close. You will need to touch up. Remember the shapes [pass reject] reverse for TX and RX. One will have the pass low and notch hi the other will be reversed. Be carefull on this one. I screwed up a set of cavities once years ago. Also flex the screws to make sure they move easily etc.

When you get the one cavity hooked up - mess with it!!!! Turn screws adjustments to see what each do and how they affect each other. If you get close you can set span on 8924 to 1 MHZ and see whole shape on screen. If you can't find initial frequency then set freq to around 150 Mhz and span to say 20 Mhz. You can locate the curve and then move closer to it and expand it.

Start out and tune one cavity at a time. When you get cavities on one side aligned then hook them togehter and check fine tune the whole side.

Set up tracking generator analyzer for wide span so you can see current peak and dip.

Set space between peak and dip.

Move whole curve to close to correct spot.

Make span more narrow so you can see exact shape etc of peak and or dip. Then fine tune.

The pass peak is best tuned [not essential] with the RLB as it is more sensitive and shows the exact location of the pass which is the highes Return Loss. It is also critical to have the dip at the right spot to reject trans into receiver. You and also fine tune this with and RLB by going for the lowest return loss.

It looks like you are new to the 8924C and it is like telling sombody how to fly a 747 when they just got in the cockpit. Lot of controls and variable.

I have been in electronics all my life [degrees in Chemical, Mechanical, Electrical Eng] and it took me over a year to get comfortable with my 8924 and I am still finding stuff I didn't know it had. Also don't the let the assholes kid you; the manuals are "minimum essential" at best.

Sorry about the profanity guys!!!

Thought I was sending to Bob off list and hit wrong button.

Have sent PDF copy of 8920B Applications manual that I have. I had Office Depot Print it out for me so I have paper copy to reference. The several manuals I have in PDF printed out at nearly a 1000 pages.

Most aren't very helpfull. As many of you have pointed out it there is no "silver bullet" and a lot of background knowledge is required. It's like trying to tell someone how to fly a new plane if they have never been a pilot.

The bottom line is I love my 8924C and Eagle RLB1000 and can't remember how I got along without them.

# 1198. HP8920A/B Training Tape on VHS UPDATE Number 3 (Duplexer Tuning!)

Yahoo group: hp8924
Date: 2012-10-23 17:04:30 UTC
From: rfiemiguy
Topic: 1198  Message: 1198

To all:

The digital version of the HP8920A/B Factory Training VHS Tape is still available on line.

By the way at about 22 minutes there is a demo tuning of a duplexer. I think it is a band reject duplexer. A pass reject duplexer has extra required steps of tuning the passbands.

Use these links or try the link I just added to the "LINKS" section. You will need an MPEG 4 codec to view this, so you might have to download one.

I loaded into my iPod Touch and it works fine, but the button and screen labels on the instrument are tiny!

# 1199. RF Tools

Yahoo group: hp8924
Date: 2012-10-24 00:07:27 UTC
From: MICHAEL SMITH
Topic: 1199  Message: 1199

I have been playing with the RF Tools and when I load the "North American FM Test" (NA_FM) I get this error:

Error 18 in 1356 String ovfl. or substring err

Any ideas? Is it a problem with the PCMCIA card or data? Or a problem with the 8924C? Or operator error. Everything else loads fine.

Sent from my iPhone 5

This has been discussed before. Some of those programs don't run on the later models. I suspect it has to do with hardware differences. I intend to take a look at the source code at some point, but don't know when that will be

Just a "for what its worth".
I've owned and used HP test equipment since the early '60s beginning with a modified 5532A frequency counter and then a 5245L, 500Mc. counter among others. One thing that has always stood out in my observation of HP gear is that the manuals supplied with the equipment have always been very cryptic and difficult to understand. Its as if the manuals were prepared, not by tech. writers, but by the engineers who designed the equipment themselves (don't know whether that is true or not but seems that way). The assumption is very clear that the user is totally familiar with the application and uses of the equipment even before opening the box. Perhaps this is so because their equipment was rarely sold to individuals or small shops but, rather, to large organizations who (1) could afford the equipment and (2) could afford to organize and supply the requisite training to go with the equipment.
I, personally, was fortunate in having a friend who was an HP engineer working in the test equipment division who not only made me aware of the appropriate product for my needs but supplied the necessary "education" in its proper use and, in the case of the 5532, even supplied modification information to extend its frequency range considerably beyond its design specs. As a result, my experience was a little bit more "streamlined" than some others.
I have, however, experienced this problem with the 8924 even though I sorta know what to expect from the manuals and the instrument. (Anybody remember HP's calculators? The RPN notation? Another example of what I am trying to convey.)
That said, after spending a dozen hours or so with my 8924, I wouldn't trade it for the world. As with anything HP, it will pay back my investment in time with capability and accuracy only dreamt about by the competition. Of course YMMV.

Amen!!!!!!

Couldn't have said it better.

I spent 28 years with Dupont and my group was responsible for writing manuals on how to fabricate Acrylic sheet and Corian. These were aimed at professional installers. I would insist that my guys go to the field and spend a week with an installer so they knew what they were doing and then when the draft of the manual was ready we went back to the field with a new installer and tried to follow the manual exactly. We had some interesting times.

I was a senior mid-level manager and when I needed to clear my head I would go to the field and work with a fabricator/installer for several days. I was working in Spartanburg SC one morning in the summer in the thermoforming room with the Kohler crew around 6 am. I had taken off my usual business suit and was in slacks and a T shirt when the plant manager and some of the corporate guys came throught. The wanted to know who I was and were incredulous as they apparently had never had a supplier manager or vendor in the 120 F thermoforming room working with their crew. Kohler substiantly increased their purchases from us and we remained a major suppier to them for many years. Later when Kohler bought Neomidian I had a personal request to give Kohler corporate a report on the state of the thermoforming technology.

Interested in why use a return loss bridge to tune a duplexer or cavity ?

Just seems really unnecessary when you can just hook on the to the output port and directly measure the insertion and rejection losses.

Maybe I am missing something but have done very complex combiner and duplexer configurations with just the basic Service Monitors.

Really boils down to getting the least amount of de-sense with the minimum insertion losses

An RLB allows you to fine tune the pass portion much better than with the service monitor alone. It provides a nice tight notch to tune to, rather than a relatively vague peak.

If you ever tune with an RLB, you will notice (95% of the time) that the amount of power lost in a cavity (insertion loss) is less than if tuned with the service monitor alone. I can't explain it, but it is true.

For anyone that dares to tune under power, you will notice that there is always a little more sensitivity or power you can squeeze from fine tuning a cavity even if it is tuned perfectly. This power I find does not increase at all if an RLB is used to tune the same cavity.

There is nothing wrong with using a service monitor by itself. You just get magnitudes more resolution with an RLB when tuning for minimum insertion loss.

The same is true for the opposite - An RLB CAN tune a notch, but the service monitor gives you a much better representation of the notch than trying to peak the output through an RLB.

From: Brian Swann
Topic: 1172  Message: 1205

The simple answer is you will be optimizing the return loss (aka: VSWR) of the cavity by tuning with the RLB. If you are tuning using the insertion loss method, you will not know what impedence the cavity is reflecting back to the transmitter or receiver.

You could test by inserting a FWD/REF power meter in line after you tune and keying the transmitter, but you can't really tune under power to optimize. You would have to move it a little, and test, move it more and test, etc.

Take a look at this video (produced by a very handsome HAM :) )
Return Loss Bridge Basics

Hi,
This might also be a memory issue. To run NA FM tests on a 8920A you need a optional 512K RAM expansion. I don't know how much free RAM a 8924C has.

Robert.

Subject: [hp8924] RF Tools

I have been playing with the RF Tools and when I load the "North American FM Test" (NA_FM) I get this error:

Error 18 in 1356 String ovfl. or substring err

Any ideas?  Is it a problem with the PCMCIA card or data? Or a problem with the 8924C?  Or operator error. Everything else loads fine.

This youtube vidio explains it well.

http://www.youtube.com/watch?v=ghJHPX9f5aE

Mainly it seems to be more precise.  Tuning a duplexer for maximan signal works well and many are tuned that way.  Often you can turn the adjustment screw a turn or two and not see too much differance in the pass loss.  The RLB will show up with jjust a half turn or so.

The RLB is just a SWR measurment that can be done with very low power.

Interested in why use a return loss bridge to tune a duplexer or cavity ?

Just seems really unnecessary when you can just hook on the to the output port and directly measure the insertion and rejection losses.

Maybe I am missing something but have done very complex combiner and duplexer configurations  with just the basic Service Monitors.

Really boils down to getting the least amount of de-sense with the minimum insertion losses

I do not recall the error, but I was getting an error on the FMNA program on a 8924c.  By edditing out a line , the program would load and start to run,but would lock up or something.  From that I doubt it is a memory problem in my 8924c.

Hi,
This might also be a memory issue. To run NA FM tests on a 8920A you need a optional 512K RAM expansion. I don't know how much free RAM a 8924C has.

Robert.

# 1209. AF GEN1 Not working

Yahoo group: hp8924
Date: 2012-10-27 03:48:44 UTC
From: cj7124
Topic: 1209  Message: 1209

I have a 8924C that the AF Gen 1 does not appear to be working. The AF Gen 2 is working. Other than the obvious way of turning the AF Gen 1 off/on on the RX Test screen, is there some other setting that would cause the AF Gen 1 not to operate? It does not modulate on FM nor is there a signal on the AUDIO OUT jack when that is selected.

It can also be set for AM. If you go to the RX test screen, what are the leters in the AG GEN1 spot ? It should tell where it is connected to. It should be going to the same place (FM) that AF Gen 2 is going if you are testing FM.

Thanks fellows for the replies. Ralph, you are right on. I finally found a quick mention of this in the 8920A manual and it says to measure very small signals using the spectrum analyzer & marker as you suggest. I had thought of it too but hoped for a more direct readout perhaps on the RF analyzer screen. But no matter as it still gets the job done. Thanks again!

The agilent website has circuit level details on the 8920 series - think they may have also been posted to the group file section. Pretty sure the attenuator for 8920A, 8920B and some versions of the 8924C were the same. From memory, the circuits show both the electronic (PIN Diode) & mechanical (relay) attenuators. About 4 different ones I think. 73s de Chris ZL1CVD

I don't know how cheap you want, but have you checked ebay? Looks like NIB for $200 from several sellers.

Joe

How do you turn down the screen brilliance ?? My appears to full up
and I would like to reduce it. I did go into the service directory
and found the horizontal and vertical stuff but nothing on the screen.

Thanks
Doug VE5DA

# 1220. Frequency Agile Marker??

Yahoo group: hp8924
Date: 2012-11-23 19:00:07 UTC
From: Doug
Topic: 1220  Message: 1220

Is it possible to set up a frequency agile marker while in the
spectrum analyzer
screen?? If so how is it done.. I could find no reference to it in the 8920
manual. Sure would be handy..

Thanks
Doug VE5DA

Hi Doug,
"Marker to" in the marker control field on the SA screen will set the marker to the highest peak, next highest, center freq or ref level.
This is pretty agile, or do you have something else in mind?

Robert G8RPI.

Hi Robert. Just getting into the 8924c. Lots of fun and time.... -19C
here today.. I am used to the old sweep gennies
we used on the old microwave systems where I could put the marker
anywhere I wanted. Either that or we could
add markers. Any Lab type instrument that I used years ago just can't
hold a candle to this one. But I do miss
having a frequency agile marker I can place anywhere. I use this
along with my MiniVNA and they do complement
on another....

Thanks

I must be missing something in this question.  If you go to the marker screen and use the position setting , you can set the marker anywhere.  By using the keys over the round knob you can set it to how much to increment the setting each time you turn the knob.  Is that not what you want to do ?

It would be nice to have atleast two markers.

Thanks Ralph I think I got it. I was able to go to position and move
it around just like I want to..
